  - Rajiv Khanna
  - Raghu Ramakrishnan
  - Xuanhui Wang
  - Liang Zhang
- Ad Targeting
  - Nagaraj Kota

# Agenda

- Topic of Interest
  - Recommender problems for **dynamic, time-sensitive** applications
    - Content Optimization (main focus today), Online Advertising, Movie recommendation, shopping,...
- Introduction (20 min, Deepak)
- Offline components (40 min, Deepak)
  - Regression, Collaborative filtering (CF), ...
- Online components + initialization (70 min, Bee-Chung)
  - Time-series, online/incremental methods, explore/exploit (bandit)
- Evaluation methods + Multi-Objective (10-15 min, Deepak)
- Challenges (5-10 min, Deepak)

# Three components we will focus on today

- Defining the problem
  - Formulate objectives whose optimization achieves some long-term goals for the recommender system
    - E.g. How to serve content to optimize audience reach and engagement, optimize some combination of engagement and revenue ?
- Modeling (to estimate some critical inputs)
  - Predict rates of some positive user interaction(s) with items based on data obtained from historical user-item interactions
    - E.g. Click rates, average time-spent on page, etc
    - Could be explicit feedback like ratings
- Experimentation
  - Create experiments to collect data proactively to improve models, helps in converging to the best choice(s) cheaply and rapidly.
    - Explore and Exploit (continuous experimentation)
    - DOE (testing hypotheses by avoiding bias inherent in data)

# Modern Recommendation Systems

- Goal
  - Serve the right item to a user in a given context to optimize long-term business objectives
- A scientific discipline that involves
  - Large scale Machine Learning & Statistics
    - Offline Models (capture global & stable characteristics)
    - Online Models (incorporates dynamic components)
    - Explore/Exploit (active and adaptive experimentation)
  - Multi-Objective Optimization
    - Click-rates (CTR), Engagement, advertising revenue, diversity, etc
  - Inferring user interest
    - Constructing User Profiles
  - Natural Language Processing to understand content
    - Topics, “aboutness”, entities, follow-up of something, breaking news,...

# Some examples from content optimization

- Simple version
  - I have a content module on my page, content inventory is obtained from a third party source which is further refined through editorial oversight. Can I algorithmically recommend content on this module? I want to improve overall click-rate (CTR) on this module
- More advanced
  - I got X% lift in CTR. But I have additional information on other downstream utilities (e.g. advertising revenue). Can I increase downstream utility without losing too many clicks?
- Highly advanced
  - There are multiple modules running on my webpage. How do I perform a simultaneous optimization?

# Problems in this example

- Optimize CTR on multiple modules
  - Today Module, Trending Now, Personal Assistant, News
  - Simple solution: Treat modules as independent, optimize separately. May not be the best when there are strong correlations.
- For any single module
  - Optimize some combination of CTR, downstream engagement, and perhaps advertising revenue.

# Recommender problems in general

- Example applications
  - Search: Web, Vertical
  - Online Advertising
  - Content
  - .....

# Important Factors

- **Items:** Articles, ads, modules, movies, users, updates, etc.
- **Context:** query keywords, pages, mobile, social media, etc.
- **Metric to optimize** (e.g., relevance score, CTR, revenue, engagement)
  - Currently, most applications are single-objective
  - Could be multi-objective optimization (maximize  $X$  subject to  $Y, Z, \dots$ )
- **Properties of the item pool**
  - Size (e.g., all web pages vs. 40 stories)
  - Quality of the pool (e.g., anything vs. editorially selected)
  - Lifetime (e.g., mostly old items vs. mostly new items)

# Factors affecting Solution (continued)

- **Properties of the context**
  - Pull: Specified by explicit, user-driven query (e.g., keywords, a form)
  - Push: Specified by implicit context (e.g., a page, a user, a session)
    - Most applications are somewhere on continuum of pull and push
- **Properties of the feedback on the matches made**
  - Types and semantics of feedback (e.g., click, vote)
  - Latency (e.g., available in 5 minutes vs. 1 day)
  - Volume (e.g., 100K per day vs. 300M per day)
- **Constraints specifying legitimate matches**
  - e.g., business rules, diversity rules, editorial Voice
  - Multiple objectives
- **Available Metadata** (e.g., link graph, various user/item attributes)

# Predicting User-Item Interactions (e.g. CTR)

- Myth: We have so much data on the web, if we can only process it the problem is solved
  - Number of things to learn increases with sample size
    - Rate of increase is not slow
  - Dynamic nature of systems make things worse
  - We want to learn things quickly and react fast
- Data is sparse in web recommender problems
  - We lack enough data to learn all we want to learn and as quickly as we would like to learn
  - Several Power laws interacting with each other
    - E.g. User visits power law, items served power law
      - Bivariate Zipf: Owen & Dyer, 2011

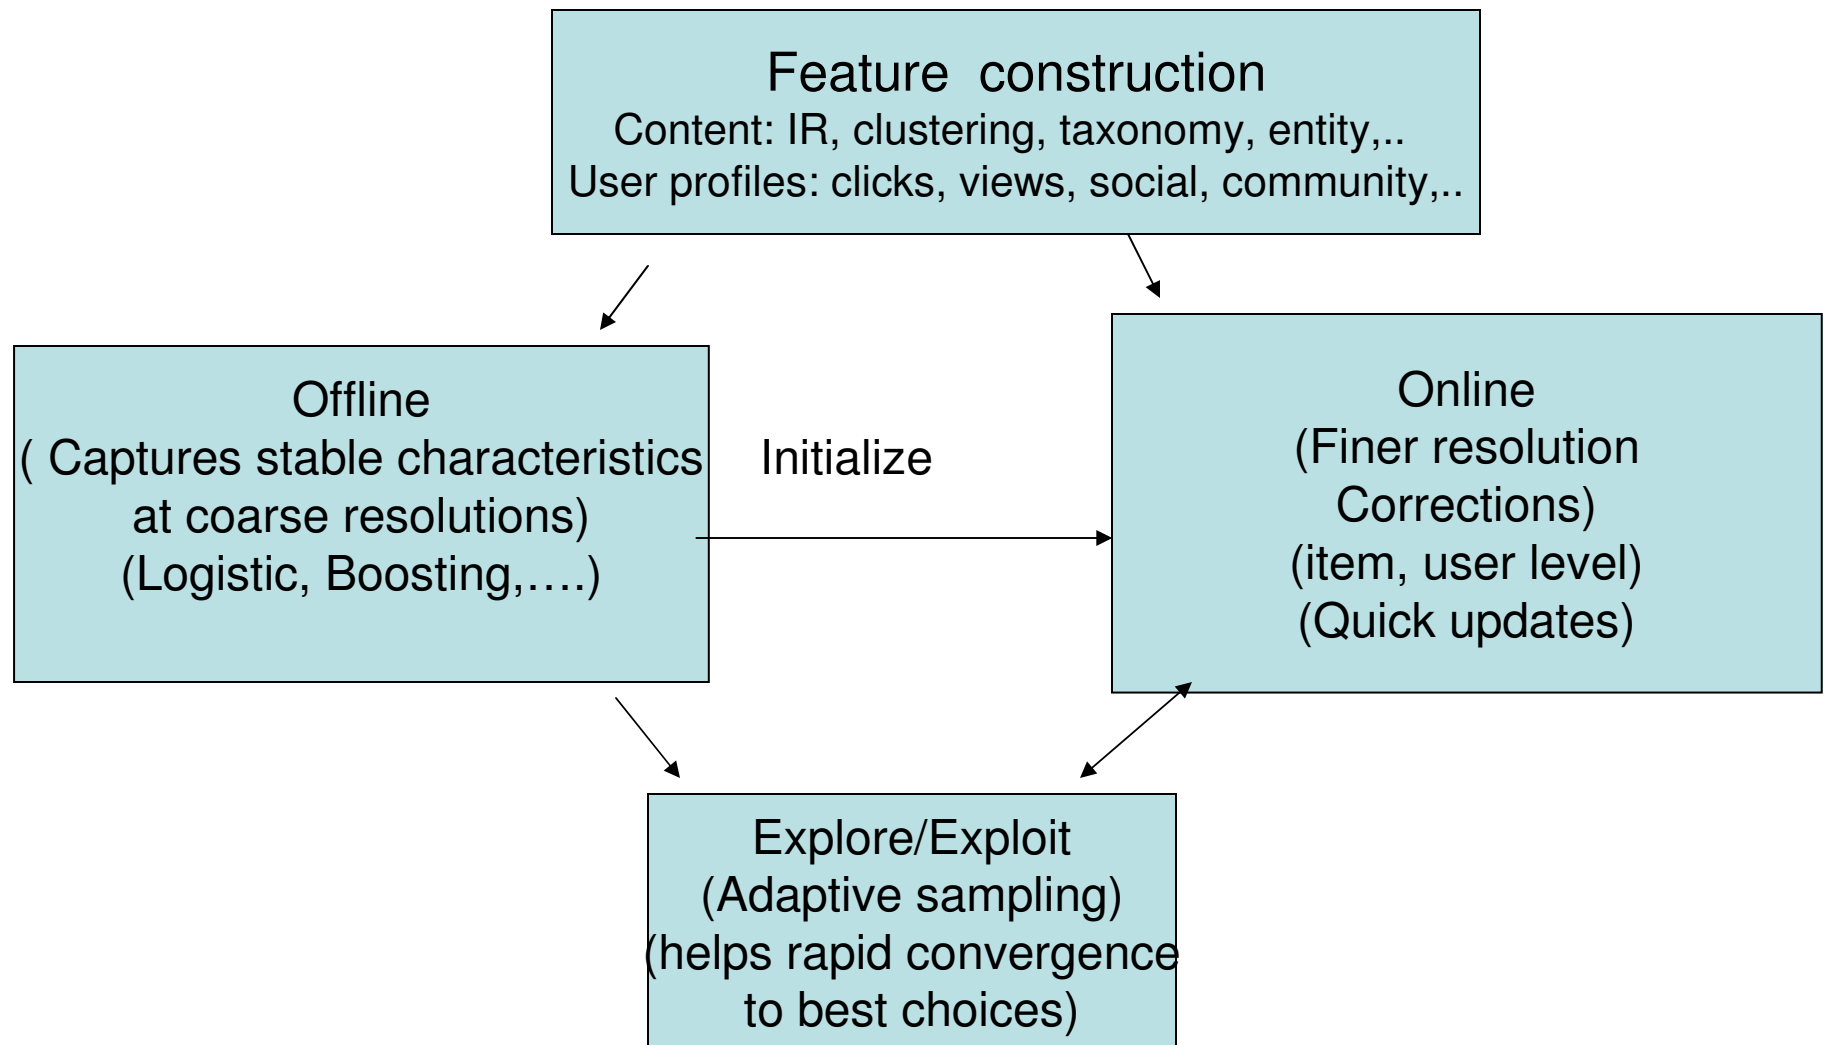

# Can Machine Learning help?

- Fortunately, there are group behaviors that generalize to individuals & they are relatively stable
  - E.g. Users in San Francisco tend to read more baseball news
- Key issue: Estimating such groups
  - Coarse group : more stable but does not generalize that well.
  - Granular group: less stable with few individuals
  - Getting a good grouping structure is to hit the “sweet spot”
- Another big advantage on the web
  - Intervene and run small experiments on a small population to collect data that helps rapid convergence to the best choices(s)
    - We don't need to learn all user-item interactions, only those that are good.

# Predicting user-item interaction rates

# Post-click: An example in Content Optimization

Recommender

EDITORIAL

FINANCE

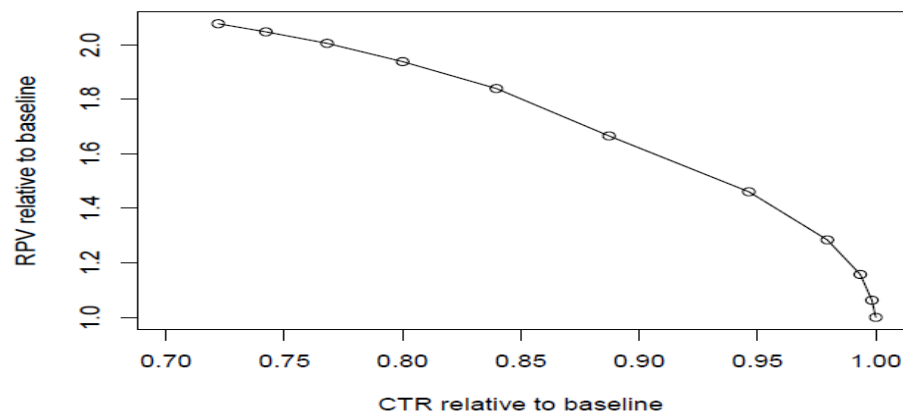

Downstream  
engagement  
(Time spent)

# Serving Content on Front Page: Click Shaping

- What do we want to optimize?
- Current: Maximize clicks (maximize downstream supply from FP)
- But consider the following
  - Article 1: CTR=5%, utility per click = 5
  - Article 2: CTR=4.9%, utility per click=10
    - By promoting 2, we lose 1 click/100 visits, gain 5 utils
- If we do this for a large number of visits --- lose some clicks but obtain significant gains in utility?
  - E.g. lose 5% relative CTR, gain 40% in utility (revenue, engagement, etc)

## **Example Application: Today Module on Yahoo! Homepage**

Currently in production, powered by some methods  
discussed in this tutorial

DAILY OFFERS  
Mortgage rates low as 3.32% APR

# Problem definition

- Display “best” articles for each user visit
- Best - Maximize User Satisfaction, Engagement
  - BUT Hard to obtain quick feedback to measure these
- Approximation
  - Maximize utility based on immediate feedback (click rate) subject to constraints (relevance, freshness, diversity)
- Inventory of articles?
  - Created by human editors
  - Small pool (30-50 articles) but refreshes periodically

# Where are we today?

- Before this research
  - Articles created and selected for display by editors
- After this research
  - Article placement done through statistical models
- How successful ?

"Just look at our homepage, for example. Since we began pairing our content optimization technology with editorial expertise, we've seen click-through rates in the Today module more than double. ----- Carol Bartz, CEO Yahoo! Inc (Q4, 2009)

# Main Goals

- Methods to select most popular articles
  - This was done by editors before
- Provide personalized article selection
  - Based on user covariates
  - Based on per user behavior
- Scalability: Methods to generalize in small traffic scenarios
  - Today module part of most Y! portals around the world
  - Also syndicated to sources like Y! Mail, Y! IM etc

# Similar applications

- Goal: Use same methods for selecting most popular, personalization across different applications at Y!
- Good news! Methods generalize, already in use

The screenshot shows two pages from Yahoo!. The top page is Yahoo! News, featuring a headline: "Afghan attacks kill 8 US soldiers in 24 hours". The bottom page is Yahoo! Finance, featuring a "TOP STORIES" section with the headline: "Stocks Wobble After Earnings, Data; Will Wall Street See 7th Straight Win?".

**Yahoo! News Article:**

**Afghan attacks kill 8 US soldiers in 24 hours**  
 AP - 2 hrs 37 mins ago  
 KANDAHAR, Afghanistan - Eight American troops died in attacks in southern Afghanistan, including a car bombing and gunfight outside a police compound in Kandahar, officials said Wednesday as the Taliban push back against a coalition effort to secure the volatile region. [Full Story](#)

**Yahoo! Finance Article:**

**Stocks Wobble After Earnings, Data; Will Wall Street See 7th Straight Win?** - AP  
 Stocks are rising slightly as optimism from Intel's strong earnings and outlook overshadows a disappointing retail sales report.

**Market Summary:**

Index	Value	Change	% Change
Dow	10,370.21	+7.19	+0.07%
Nasdaq	2,253.83	+11.80	+0.53%
S&P 500	1,095.66	+0.32	+0.03%
10 Yr Bond(%)	3.0860	-0.2800	-9.08%
Oil	77.47	+0.32	+0.41%
Gold	1,204.00	-9.30	-0.77%

# Next few hours

	Most Popular Recommendation	Personalized Recommendation
Offline Models		Collaborative filtering (cold-start problem)
Online Models	Time-series models	Incremental CF, online regression
Intelligent Initialization	Prior estimation	Prior estimation, dimension reduction
Explore/Exploit	Multi-armed bandits	Bandits with covariates
