

Query-by-Example (QBE)

Chapter 6

Example is the school of mankind,
and they will learn at no other.
-- Edmund Burke (1729-1797)

QBE: Intro

- ❖ A "GUI" for expressing queries.
 - Based on the DRC!
 - Actually invented before GUIs.
 - Very convenient for simple queries.
 - Awkward for complex queries.
- ❖ QBE an IBM trademark.
 - But has influenced many projects
 - Especially PC Databases: Paradox, Access, etc.

'Example Tables' in QBE

- ❖ Users specify a query by filling in *example tables*, or *skeletons*; we will use these skeletons in our examples.

<i>Reserves</i>	<u>sid</u>	<u>bid</u>	<u>day</u>

<i>Boats</i>	<u>bid</u>	<u>bname</u>	<u>color</u>

<i>Sailors</i>	<u>sid</u>	<u>sname</u>	<u>rating</u>	<u>age</u>

Basics

- ❖ To print names and ages of all sailors:

<i>Sailors</i>	<u>sid</u>	<u>sname</u>	<u>rating</u>	<u>age</u>
		P. _N		P. _A

- ❖ Print all fields for sailors with *rating* > 8, in ascending order by (*rating*, *age*):

<i>Sailors</i>	<u>sid</u>	<u>sname</u>	<u>rating</u>	<u>age</u>
P.			AO(1). >8	AO(2).

- ❖ QBE puts unique new variables in blank columns. Above query in DRC (no ordering):
 $\{ \langle I, N, T, A \rangle \mid \langle I, N, T, A \rangle \in \text{Sailors} \wedge T > 8 \}$

And/Or Queries

Note: MiniQBE uses a slightly different syntax!

- ❖ Names of sailors younger than 30 *or* older than 20:

<i>Sailors</i>	<u>sid</u>	<u>sname</u>	<u>rating</u>	<u>age</u>
		P.		< 30
		P.		> 20

- ❖ Names of sailors younger than 30 *and* older than 20:

<i>Sailors</i>	<u>sid</u>	<u>sname</u>	<u>rating</u>	<u>age</u>
	<u>_Id</u>	P.		< 30
	<u>_Id</u>	P.		> 20

- ❖ Names of sailors younger than 30 *and* *rating* > 4:

<i>Sailors</i>	<u>sid</u>	<u>sname</u>	<u>rating</u>	<u>age</u>
	<u>_Id</u>	P.	> 4	< 30

Duplicates

- ❖ *Single row with P*: Duplicates not eliminated by default; can force elimination by using UNQ.

<i>Sailors</i>	<u>sid</u>	<u>sname</u>	<u>rating</u>	<u>age</u>
UNQ.		P.		< 30

- ❖ *Multiple rows with P*: Duplicates eliminated by default! Can avoid elimination by using ALL.

<i>Sailors</i>	<u>sid</u>	<u>sname</u>	<u>rating</u>	<u>age</u>
ALL.	<u>_Id</u>	P.		< 30
	<u>_Id</u>	P.		> 20

Join Queries

- Names of sailors who've reserved a boat for 8/24/96 and are older than 25 (note that dates and strings with blanks/special chars are quoted):

Sailors	sid	sname	rating	age
	_Id	P._S		> 25

Reserves	sid	bid	day
	_Id		'8/24/96'

Note:
MiniQBE
uses
double
quotes

- Joins accomplished by repeating variables.

Join Queries (Contd.)

- Colors of boats reserved by sailors who've reserved a boat for 8/24/96 and are older than 25 :

Sailors	sid	sname	rating	age
	_Id	_S		> 25

Reserves	sid	bid	day
	_Id	_B	'8/24/96'

Boats	bid	bname	color
	_B	'Interlake'	P.

Join Queries (Contd.)

- Names and ages of sailors who've reserved some boat that is also reserved by the sailor with *sid* = 22:

Sailors	sid	sname	rating	age
	_Id	P.		P.

Reserves	sid	bid	day
	22	_B	
	_Id	_B	

Unnamed Columns

MiniQBE allows
P. in multiple tables

- Useful if we want to print the result of an expression, or print fields from 2 or more relations.
 - QBE allows P. to appear in at most one table!

Sailors	sid	sname	rating	age		
	_Id	P.	_R	_A	P._D	P.(R/_A)

Reserves	sid	bid	day
	_Id		_D

"Negative Tables"

- Can place a negation marker in the relation column:

Sailors	sid	sname	rating	age
	_Id	P._S		

Reserves	sid	bid	day
¬	_Id	_B	

Note:
MiniQBE
uses NOT
or ~.

- Variables appearing in a negated table must also appear in a positive table!

Aggregates

- QBE supports AVG, COUNT, MIN, MAX, SUM
 - None of these eliminate duplicates, except COUNT
 - Also have AVG.UNQ. etc. to force duplicate elimination

Sailors	sid	sname	rating	age	
	_Id	G.	G.P.AO	_A	P.AVG._A

- The columns with G. are the *group-by* fields; all tuples in a group have the same values in these fields.
 - The (optional) use of .AO orders the answers.
 - Every column with P. must include G. or an aggregate operator.

Conditions Box

- ❖ Used to express conditions involving 2 or more columns, e.g., $_R/_A > 0.2$.
- ❖ Can express a condition that involves a group, similar to the HAVING clause in SQL:

Sailors	sid	sname	rating	age	CONDITIONS
		G.P.		$_A$	$\text{AVG}_A > 30$

- ❖ Express conditions involving AND and OR:

Sailors	sid	sname	rating	age	CONDITIONS
		P.		$_A$	$20 < _A \text{ AND } _A < 30$

Find sailors who've reserved all boats

- ❖ A division query; need aggregates (or update operations, as we will see later) to do this in QBE.

Sailors	sid	sname	rating	age	
		P.G.		$_Id$	

Reserves	sid	bid	day	CONDITIONS
	$_Id$	$_B1$		$\text{COUNT}_B1 = \text{COUNT}_B2$

Boats	bid	bname	color
	$_B2$		

- ❖ How can we modify this query to print the names of sailors who've reserved all boats?

Inserting Tuples

- ❖ Single-tuple insertion:

Sailors	sid	sname	rating	age
I.	74	Janice	7	14

- ❖ Inserting multiple tuples (*rating* is null in tuples inserted below):

Sailors	sid	sname	rating	age	CONDITIONS
I.	$_Id$	$_N$		$_A$	$_A > 18 \text{ OR}$
Students	sid	name	login	age	$_N \text{ LIKE 'C%'}$
	$_Id$	$_N$		$_A$	

Delete and Update

- ❖ Delete all reservations for sailors with *rating* < 4

Sailors	sid	sname	rating	age
	$_Id$		< 4	

Reserves	sid	bid	day
D.	$_Id$		

- ❖ Increment the age of the sailor with *sid* = 74

Sailors	sid	sname	rating	age
	74			$\text{U}_A + 1$

Restrictions on Update Commands

- ❖ Cannot mix I, D, and U. in a single example table, or combine them with P. or G.
- ❖ Cannot insert, update or modify tuples using values from fields of other tuples in the same table. Example of an update that violates this rule:

Sailors	sid	sname	rating	age
		john		$_A$
		joe		$\text{U}_A + 1$

Should we update every Joe's age?
Which John's age should we use?

Find sailors who've reserved all boats (Again!)

- ❖ We want to find sailors $_Id$ such that there is no boat $_B$ that is not reserved by $_Id$:

Sailors	sid	sname	rating	age
	$_Id$	P. $_S$		

Boats	bid	bname	color	Reserves	sid	bid	day
\neg	$_B$			\neg	$_Id$	$_B$	

- ❖ Illegal query! Variable $_B$ does not appear in a positive row. In what order should the two negative rows be considered? (Meaning changes!)

A Solution Using Views

- ❖ Find sailors who've not reserved some boat _B:

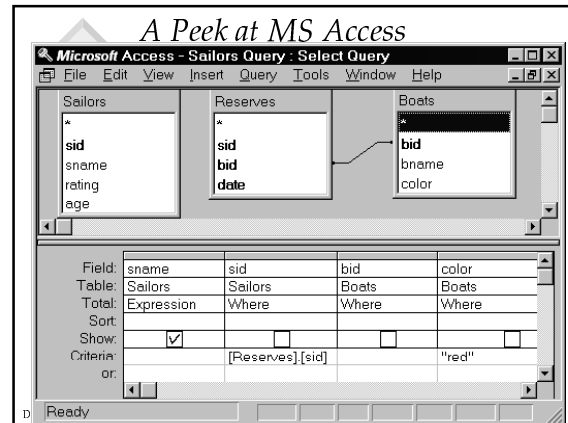

Sailors	sid	sname	rating	age	BadSids	sid
	_Id	P._S			I.	_Id

Boats	bid	bname	color	Reserves	sid	bid	day
	_B			⌞	_Id	_B	

- ❖ Next, find sailors not in this 'bad' set:

Sailors	sid	sname	rating	age	BadSids	sid
	_Id	P._S			⌞	_Id

A Peek at MS Access

Summary

- ❖ QBE is an elegant, user-friendly query language based on DRC.
- ❖ It is quite expressive (relationally complete, if the update features are taken into account).
- ❖ Simple queries are especially easy to write in QBE, and there is a minimum of syntax to learn.
- ❖ Has influenced the graphical query facilities offered in many products, including Borland's Paradox and Microsoft's Access.
