

DESIGNING PERSUASIVE ROBOTS:

HOW ROBOTS MIGHT PERSUADE PEOPLE
USING VOCAL AND NONVERBAL CUES

Persuasion

Part of **everyday life** — both professional and personal
Crucial in several spheres

Sports

Education

Health and Well-being

What makes a person
persuasive?

What makes a person
persuasive?

“Immediacy”

Immediacy

“The degree of perceived **bodily** and **psychological closeness** between people”

[Mehrabian 1971]

Immediacy shaped by

Bodily, vocal, verbal cues

Cues Shaping Nonverbal Immediacy

Behavioral cues

Cue Affordances

Moves around class room
when teaching.

Proximity

Gestures when talking to the class.

Gestures

Looks at the class when talking.

Gaze

Uses a variety of vocal expressions.

Vocal Expressions

Persuasive Behavior

Persuasive Behavior

Robots In Persuasive Roles

How do we design
persuasive robots?

Design Space

Design Space

Design Space

Nonverbal cue #1: **Proximity**

Proximity known to affect **compliance**

[Hall 1966, Glick et.al 1988]

Nonverbal cue #1: **Proximity**

Proximity known to affect **compliance**

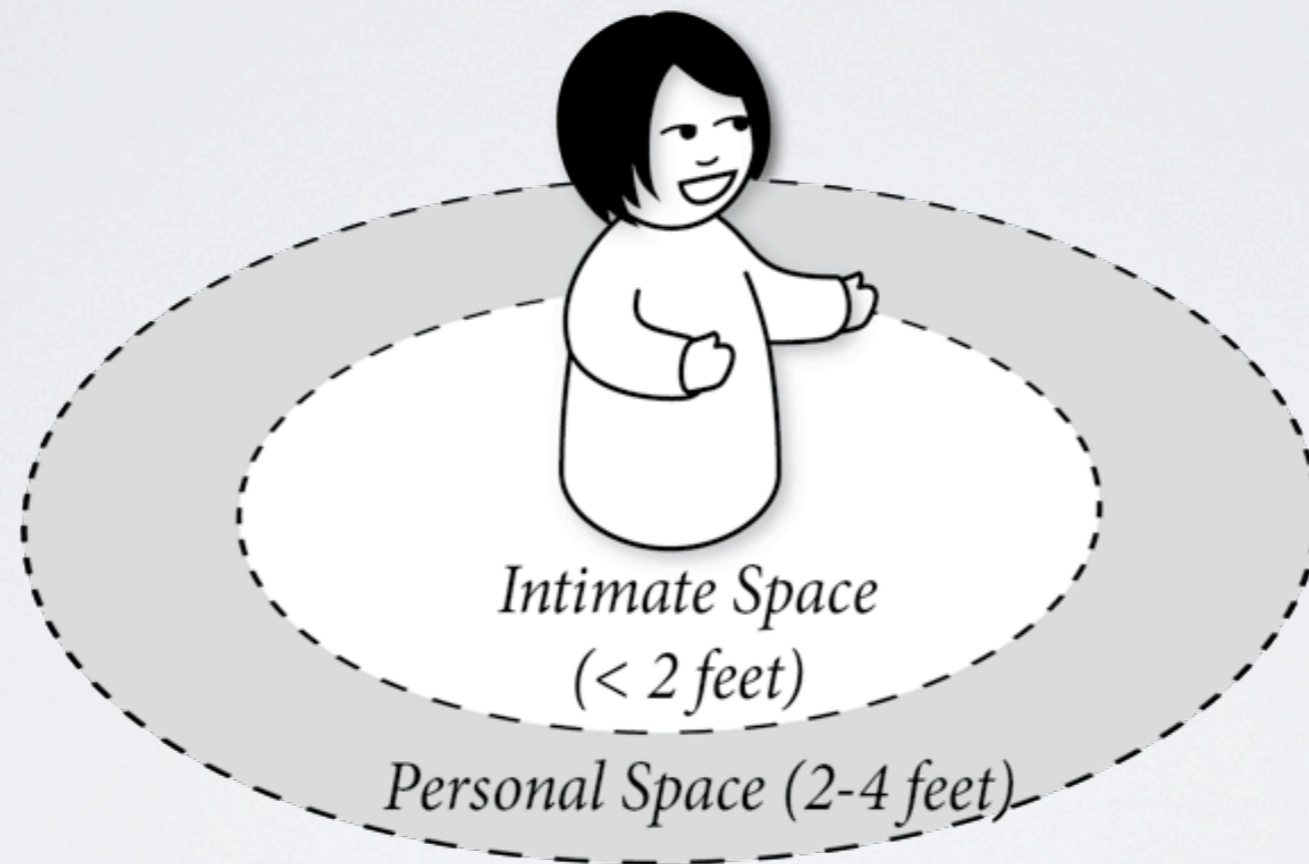

[Hall 1966, Glick et.al 1988]

Nonverbal cue #1: Proximity

Proximity known to affect **compliance**

[Hall 1966, Glick et.al 1988]

Nonverbal cue #1: Proximity

Proximity known to affect **compliance**

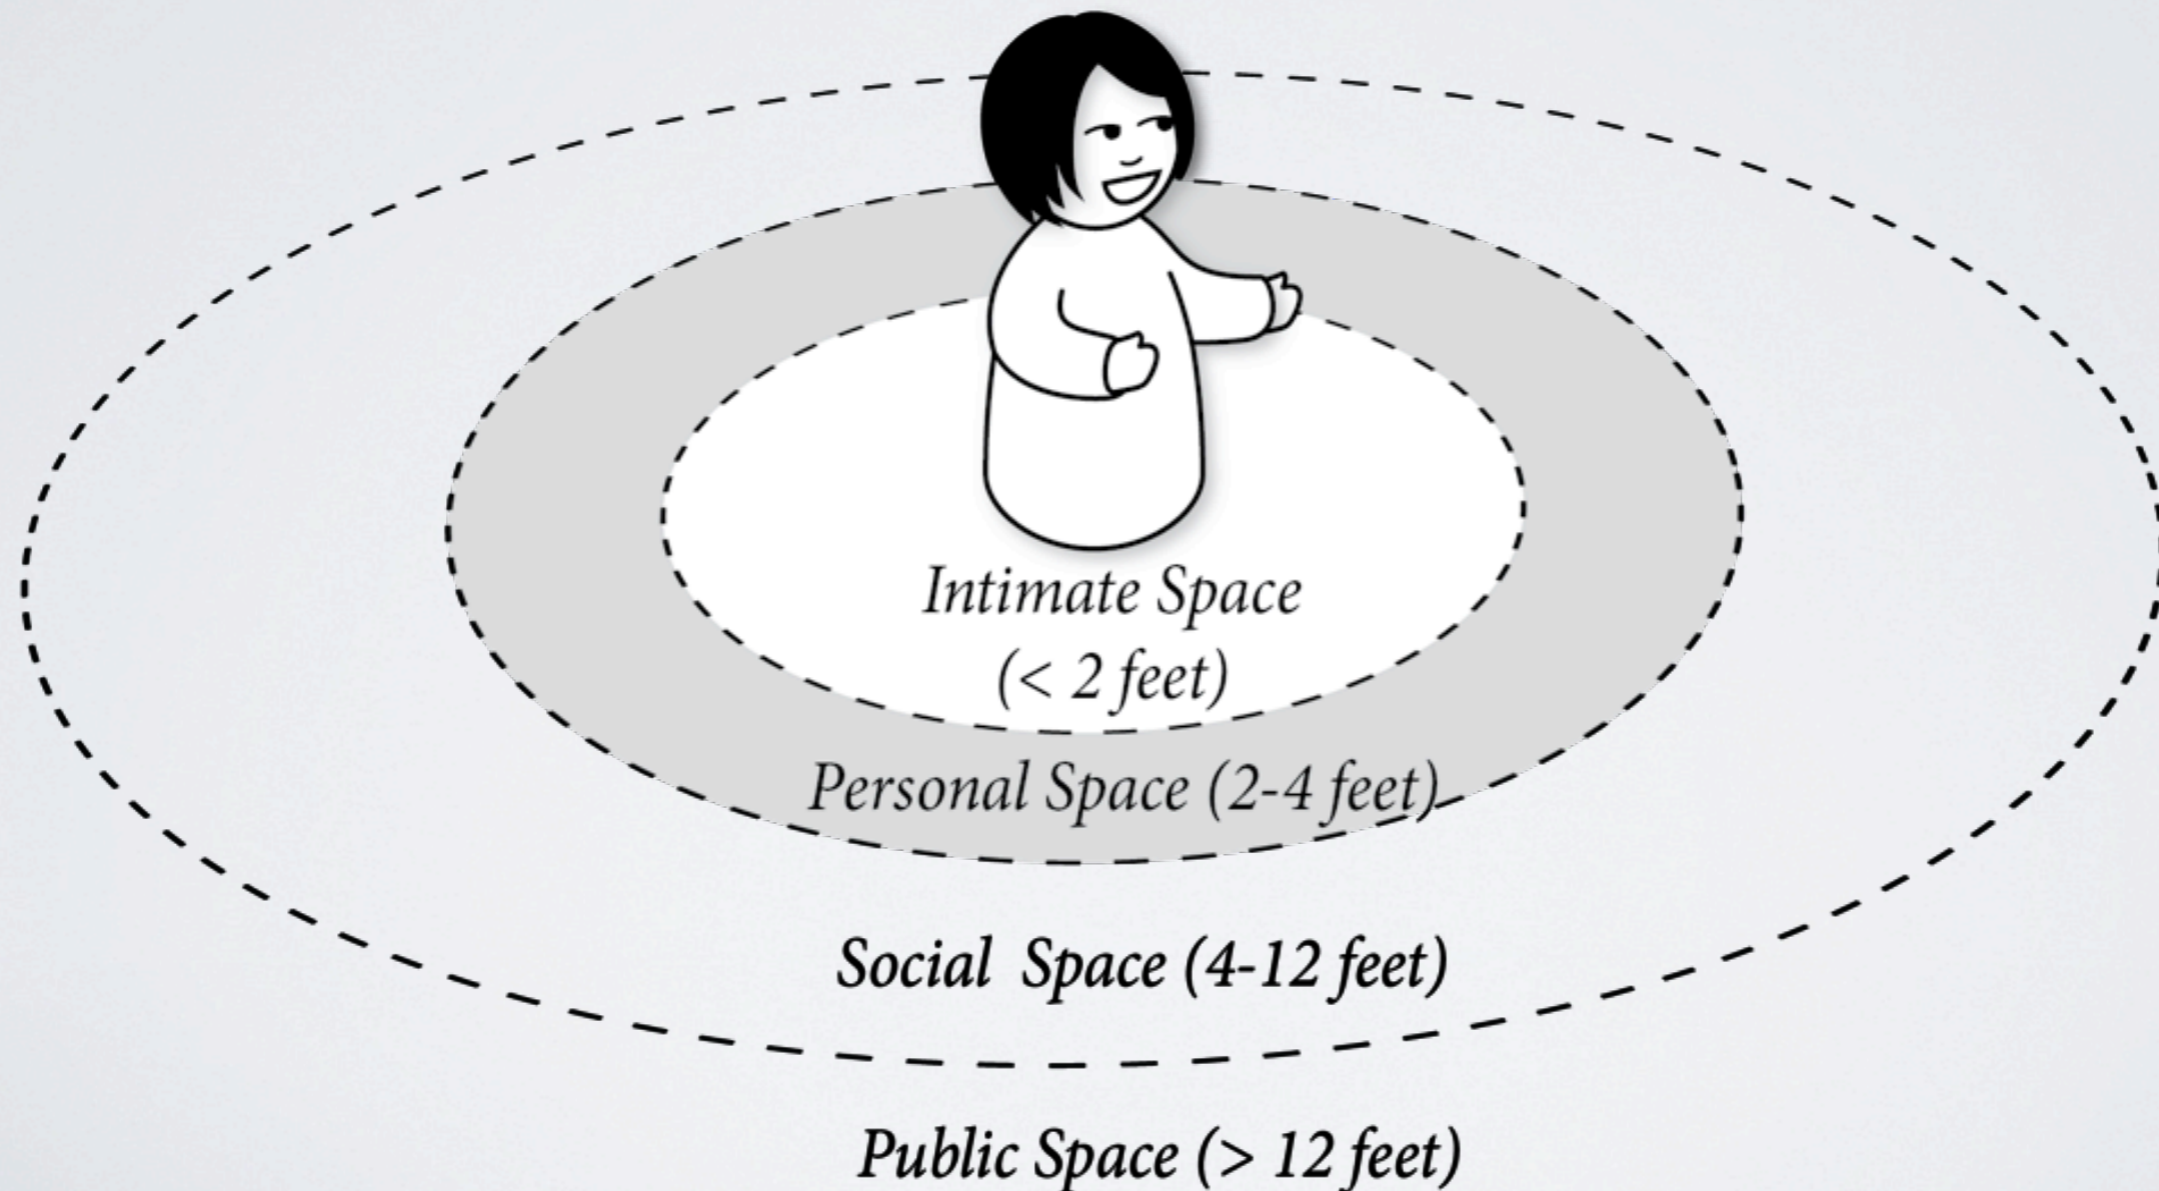

[Hall 1966, Glick et.al 1988]

Nonverbal cue #1: Proximity

Proximity known to affect **compliance**

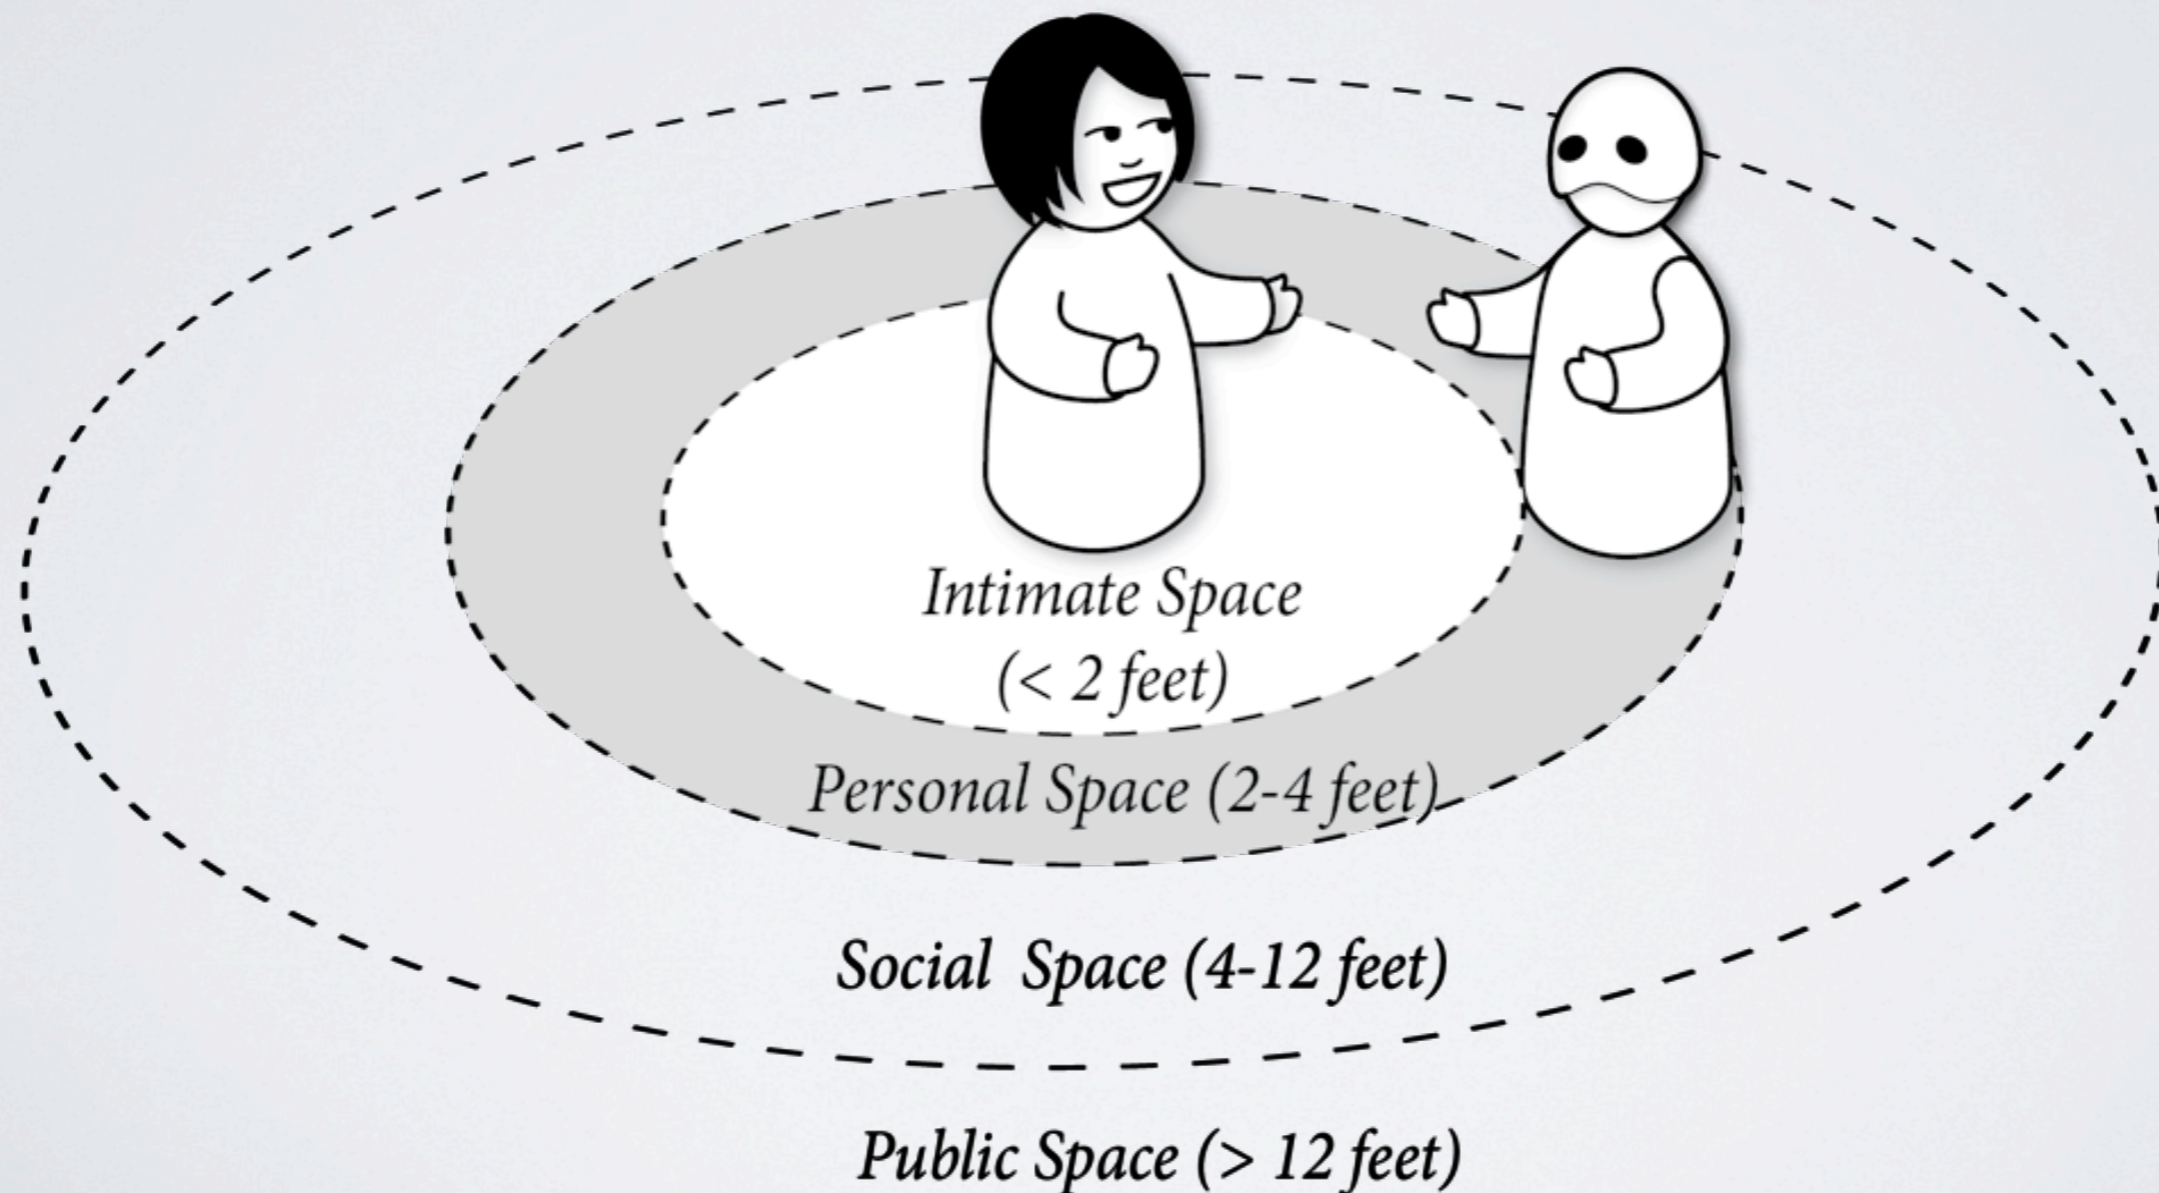

[Hall 1966, Glick et.al 1988]

Nonverbal cue #1: Proximity

Proximity known to affect **compliance**

[Hall 1966, Glick et.al 1988]

Design Space

Nonverbal cue #2: **Gaze**

Gaze cues communicate **social accessibility**

[Goffman 1969]

Robot **looks at human** when **talking**

[Kendon 1967]

Nonverbal cue #2: **Gaze**

Gaze cues communicate **social accessibility**

[Goffman 1969]

Robot **looks at human** when **talking**

[Kendon 1967]

Design Space

Nonverbal cues #3: **Gestures**

Gestures shape the persuasiveness of speech

[Maricchiolo et al. 2009]

We used four kinds of gestures in designing the behavior of the robot

[McNeil 1996, Kendon 1996, Goldin-Meadow 2005]

1. Iconic gestures
2. Metaphoric gestures
3. Deictic gestures
4. Beat gestures

Nonverbal cues #3: **Gestures**

Iconic gestures: depict a **concrete** event or object

Nonverbal cues #3: **Gestures**

Iconic gestures: depict a **concrete** event or object

Nonverbal cues #3: **Gestures**

Metaphoric gestures: depict **abstract** events

Nonverbal cues #3: **Gestures**

Metaphoric gestures: depict abstract events

Nonverbal cues #3: **Gestures**

Deictic gestures: points at objects in the environment

Nonverbal cues #3: **Gestures**

Deictic gestures: points at objects in the environment

Nonverbal cues #3: **Gestures**

Beat gestures: used to maintain rhythm

Nonverbal cues #3: **Gestures**

Beat gestures: used to maintain rhythm

Design Space

Nonverbal Cues #4: **Vocal tone**

Vocal parameters known to affect **compliance**

[Buller et al. 1986]

Used **Festival** text-to-speech system

[Taylor et al. 1998]

Manipulated vocal tone by **varying the pitch**

"The trench coat should be ranked higher."

Experimental Design

Experimental Design

Study

Two-by-two

Between-participants

Dependent variables

Compliance

Perception of persuasiveness

Independent variables

Use of vocal cues

Use of bodily cues

Gender

Condition	Vocal	Bodily
#1		
#2		✓
#3	✓	
#4	✓	✓

Experimental Task

Participant is shown the list

Participants ranks all the items

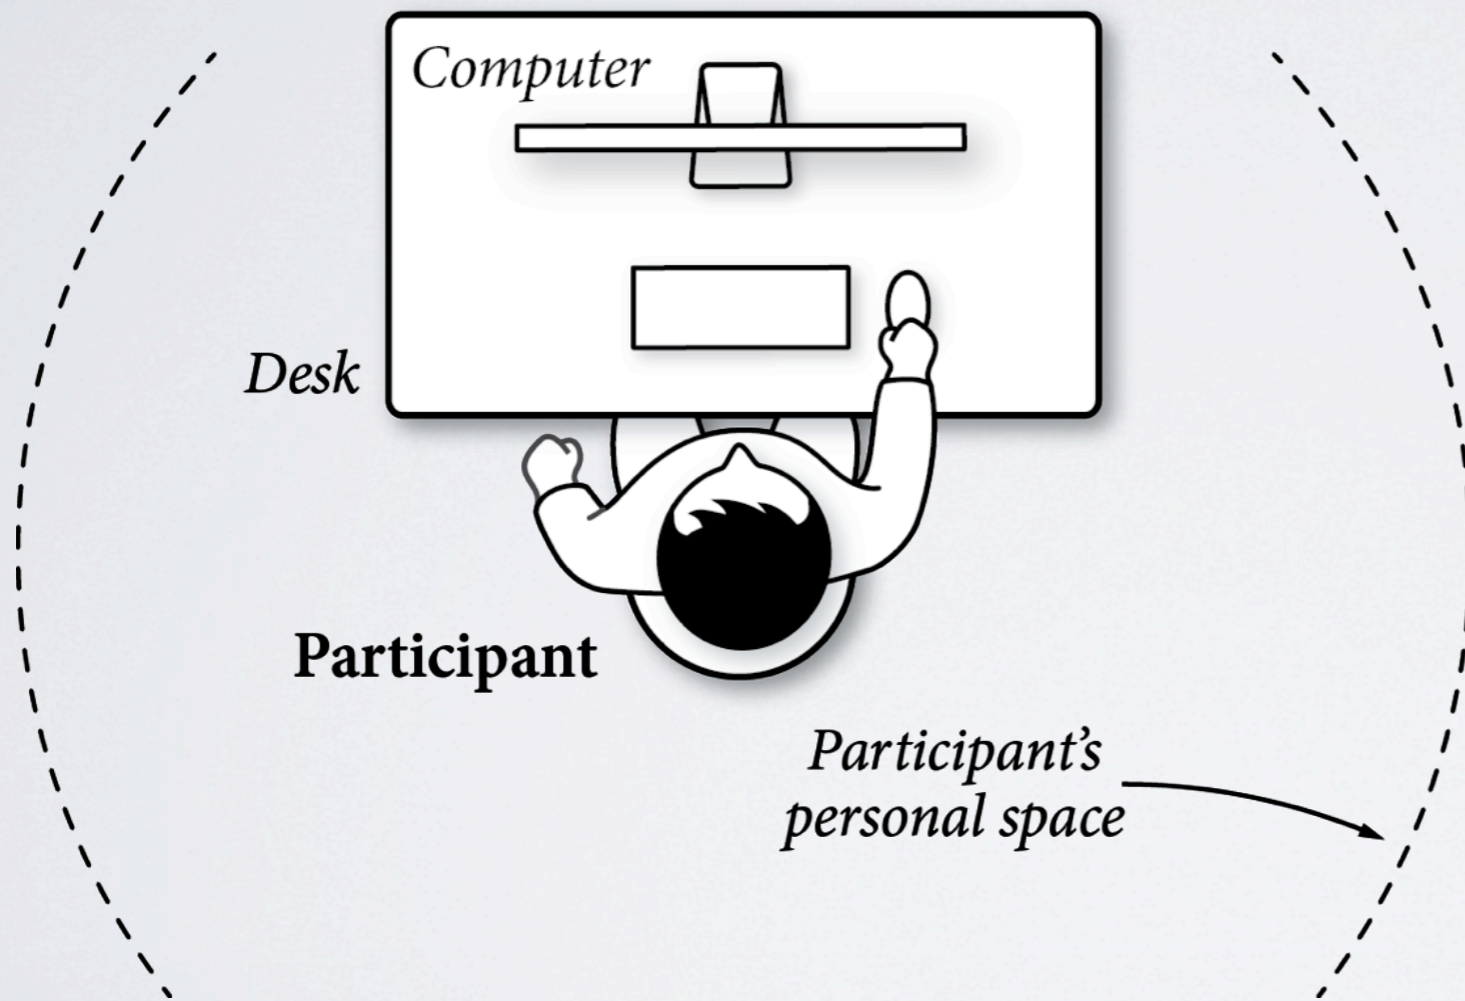

Robot makes a suggestion about a specific item

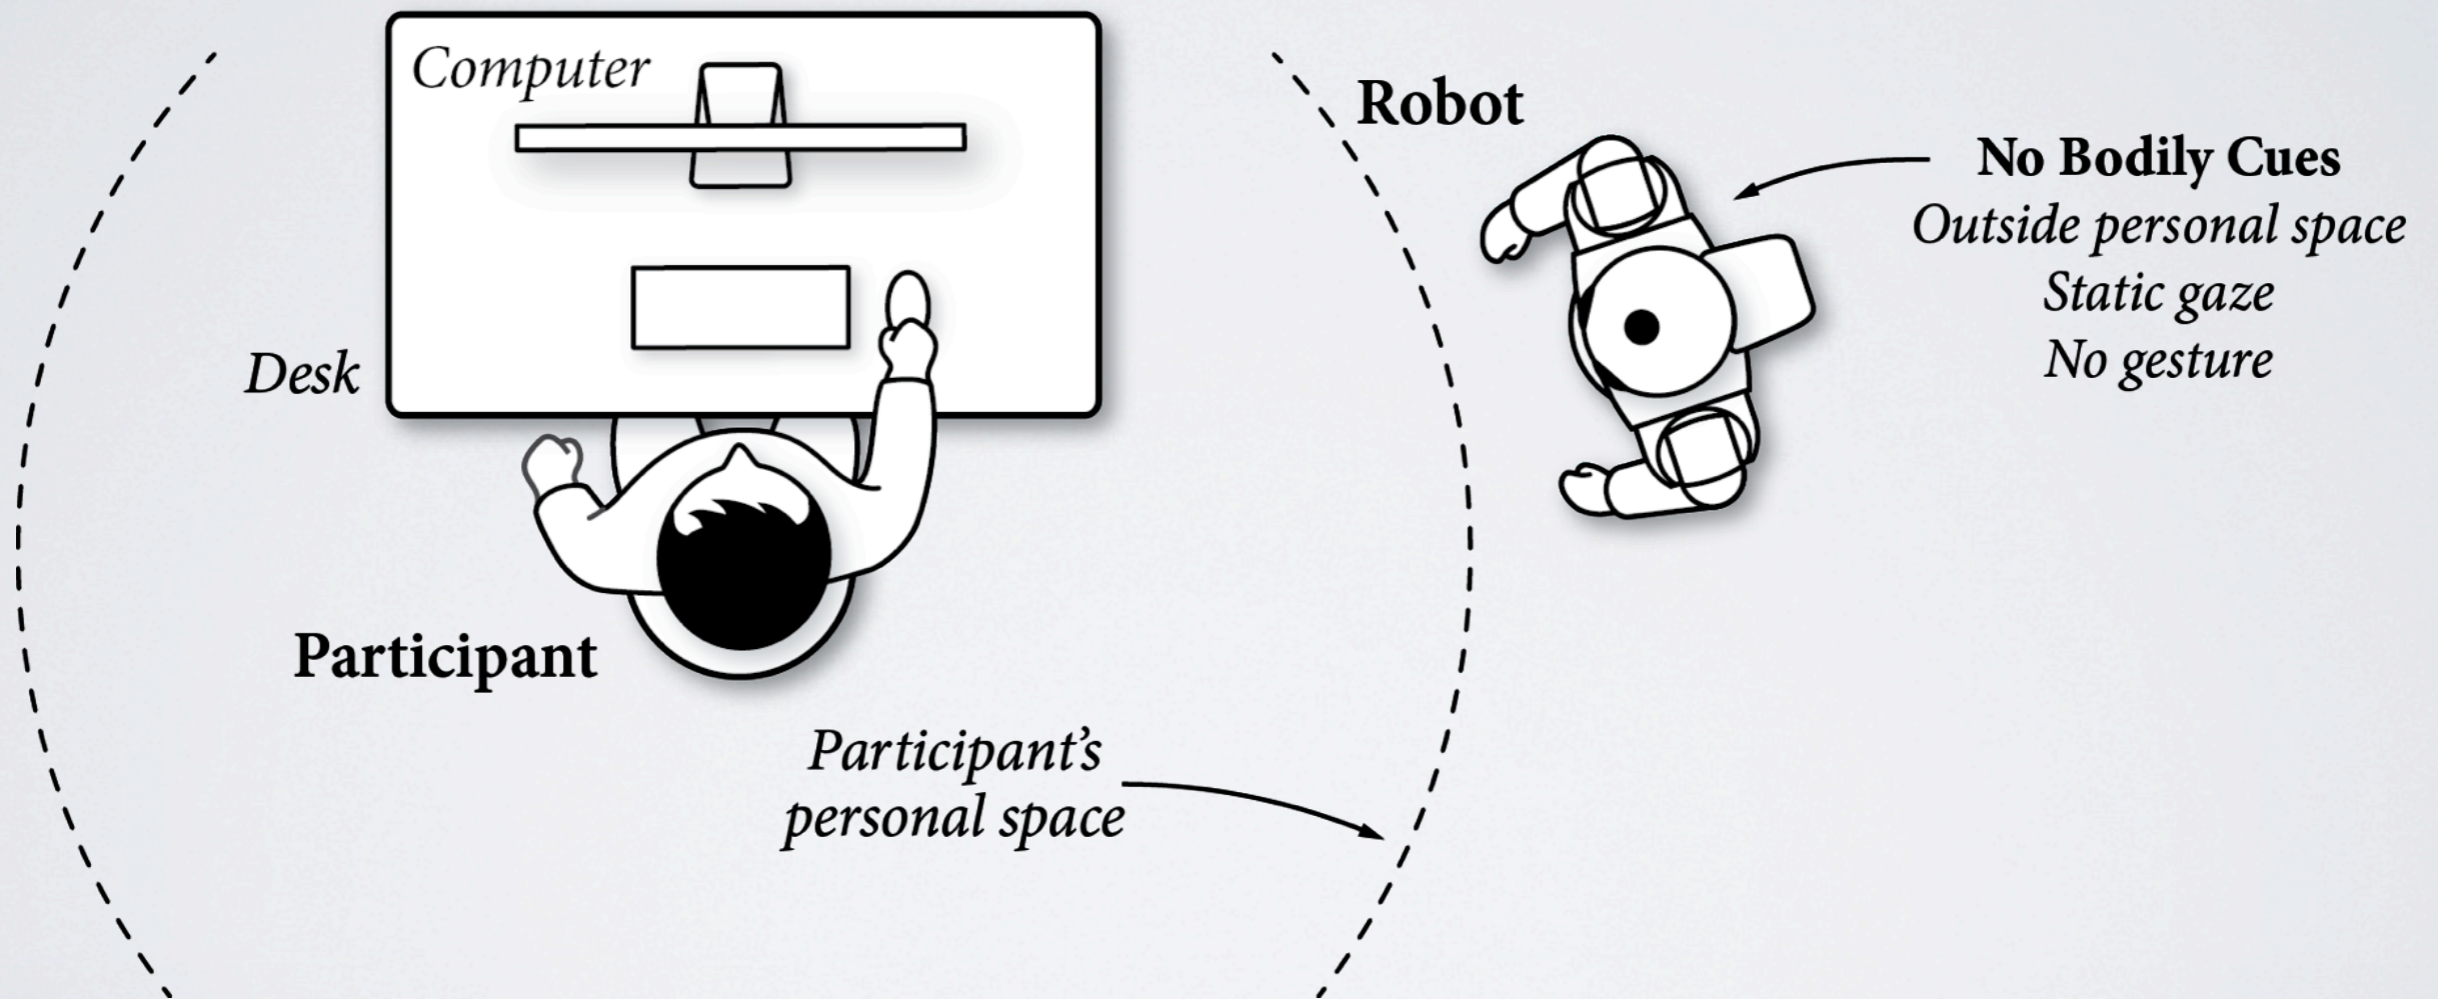

Participant listens to suggestion, and changes ranking

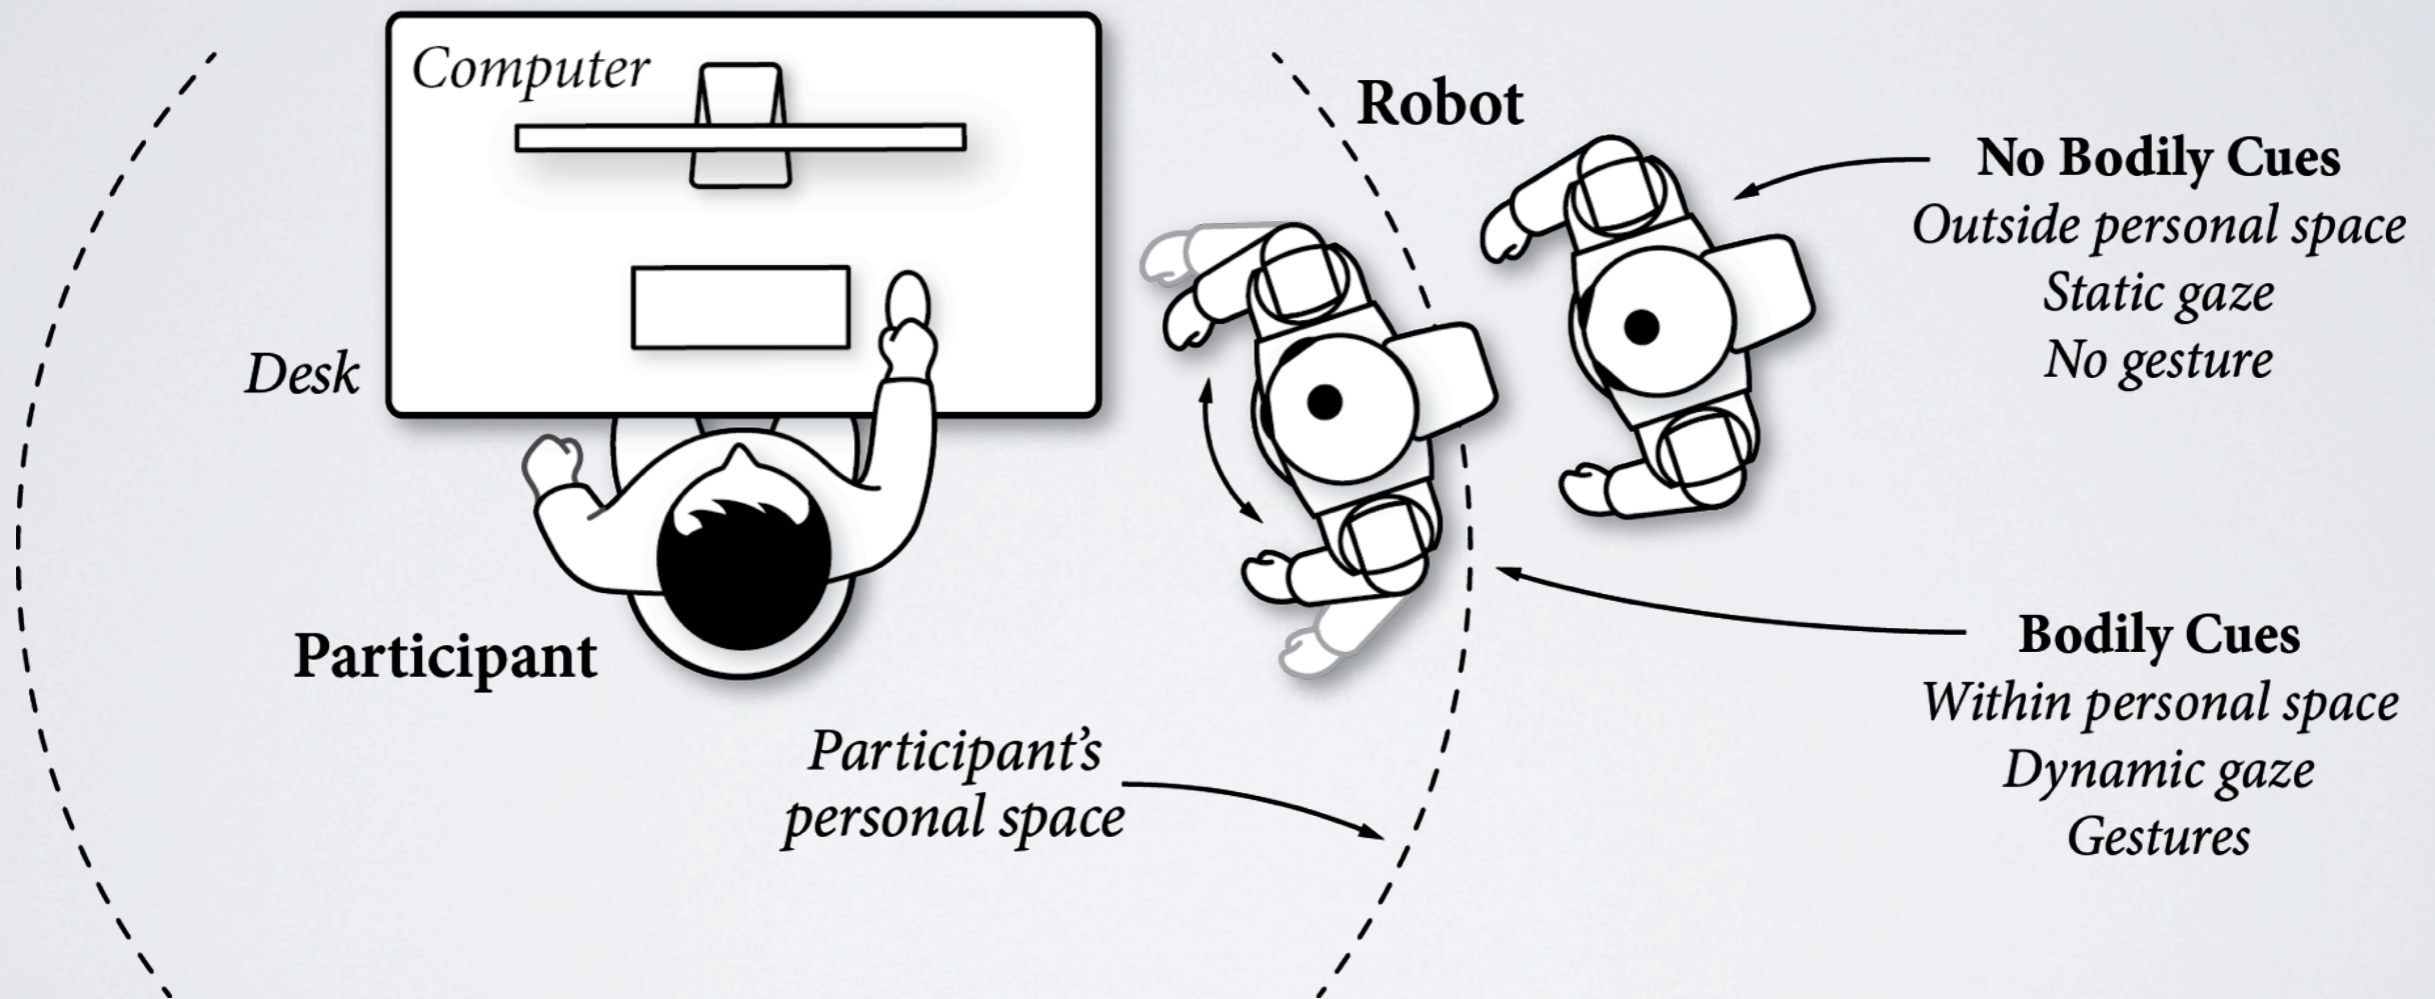

Experimental Setup

Experimental Setup

Experimental Setup

Measurements

Objective

Measured participant's **compliance** through **change in item ranking** done **after** listening to **robot's suggestions**

Subjective

Measured participant's **perception of robot** and **task experience**

Used **post-experiment** questionnaire

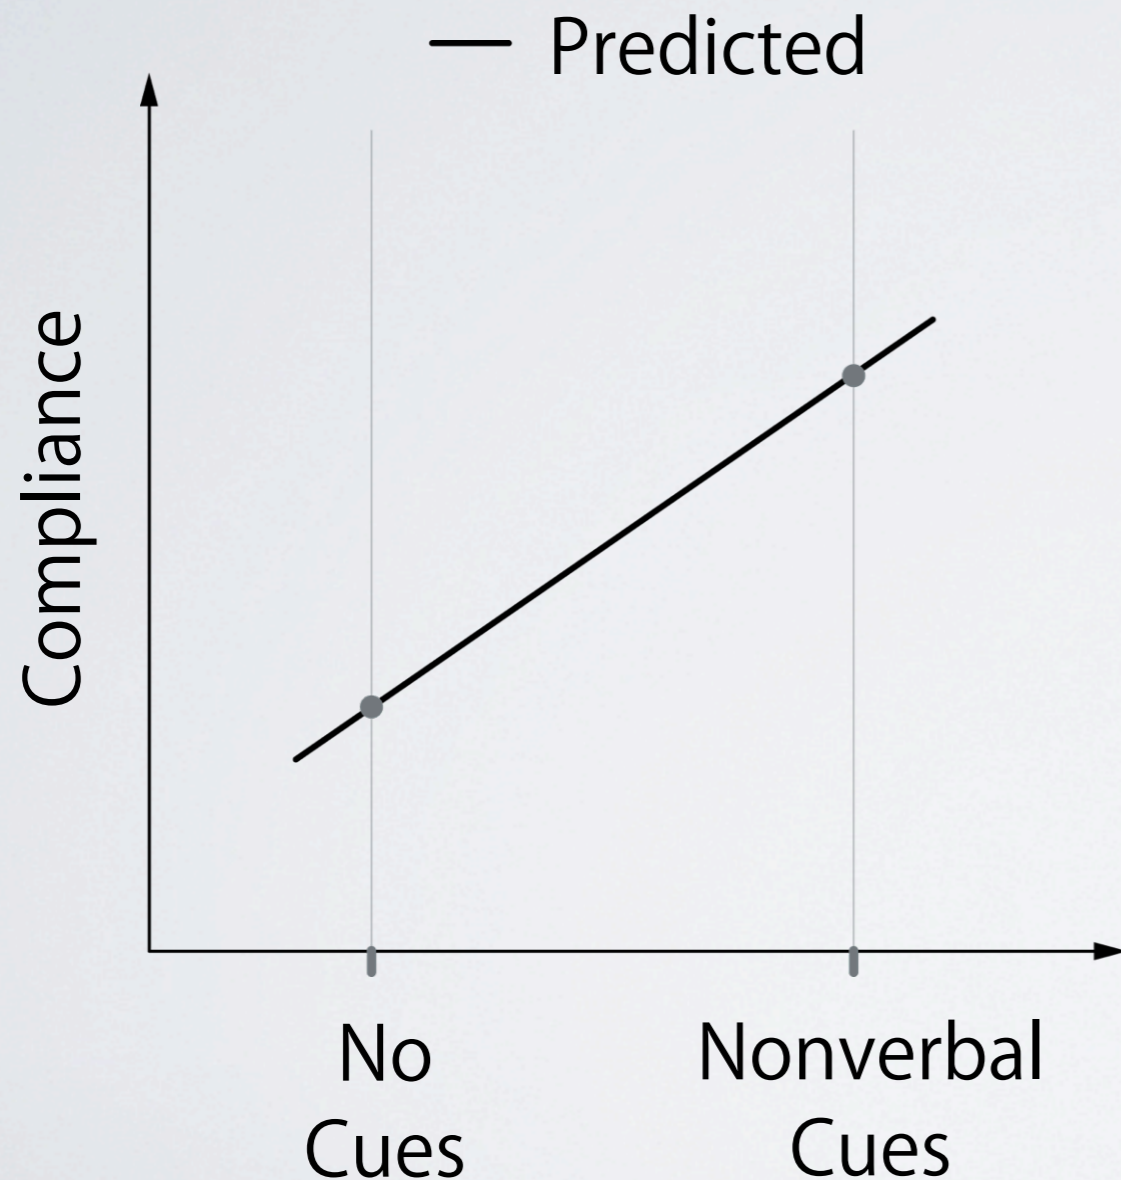

Three scales

Persuasiveness (Cronbach's $\alpha = 0.78$)

Intelligence (Cronbach's $\alpha = 0.83$)

Satisfaction (Cronbach's $\alpha = 0.79$)

Hypothesis #1

Basis

Nonverbal behavior facilitates persuasion

[Sergin 1993, Peters 2007]

Hypothesis

Compliance with the robot's suggestions will be **higher** when the robot **displays nonverbal cues** (verbal and/or bodily cues) than when it does not display nonverbal cues

Hypothesis #2

Basis

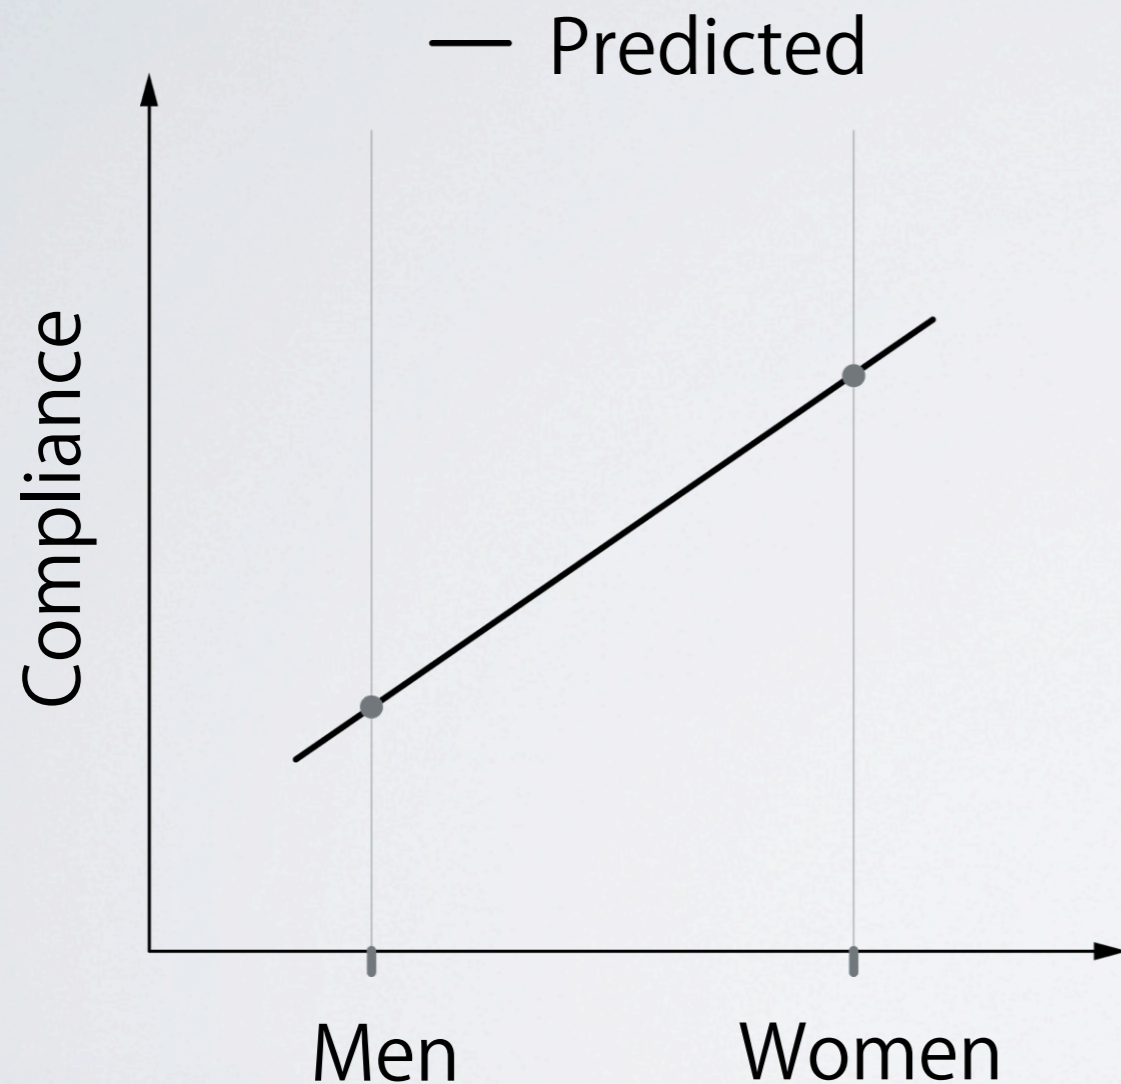

Bodily cues might play a **stronger** role than vocal cues do in **people's impressions** of others

[Mehrabian 1971]

Hypothesis

Compliance with the robot's suggestions will be **higher** when the robot employs **only bodily cues** than when it employs **only vocal cues**

Hypothesis #3

Basis

Women are **more adept** than **men** at **reading** nonverbal cues

[Hoffmann 1977, Rosip et.al 2004]

Hypothesis

Women's compliance with the robot's suggestions will be **higher** than that of **men** in the presence of **nonverbal cues**

Participants

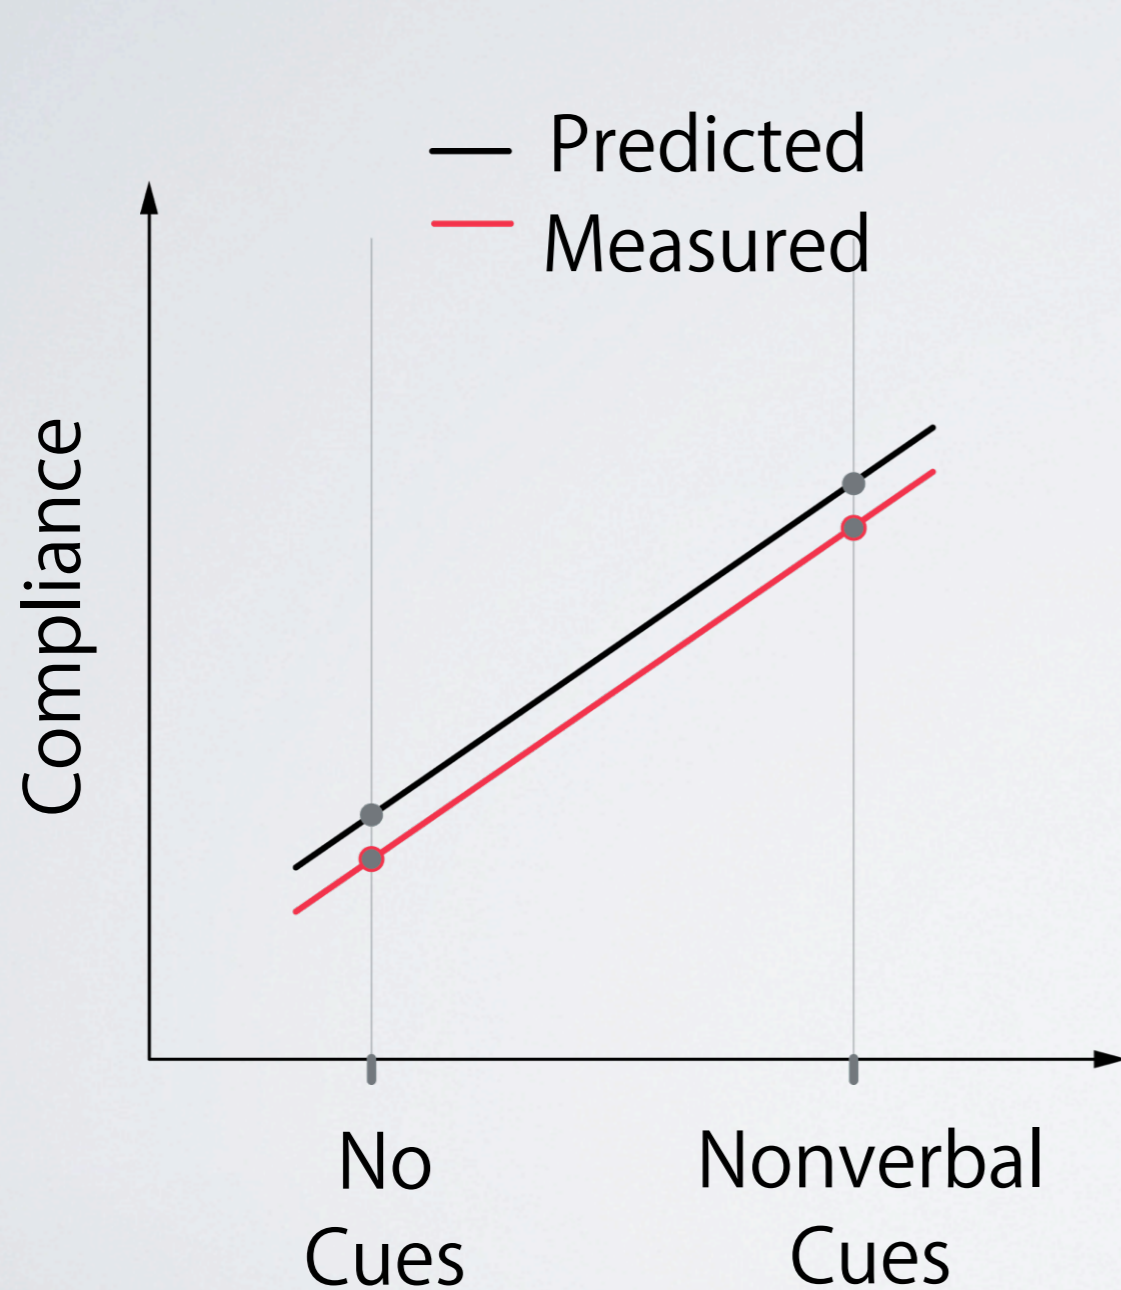

32 participants were recruited (M age = 25.39)

Gender balanced within each condition

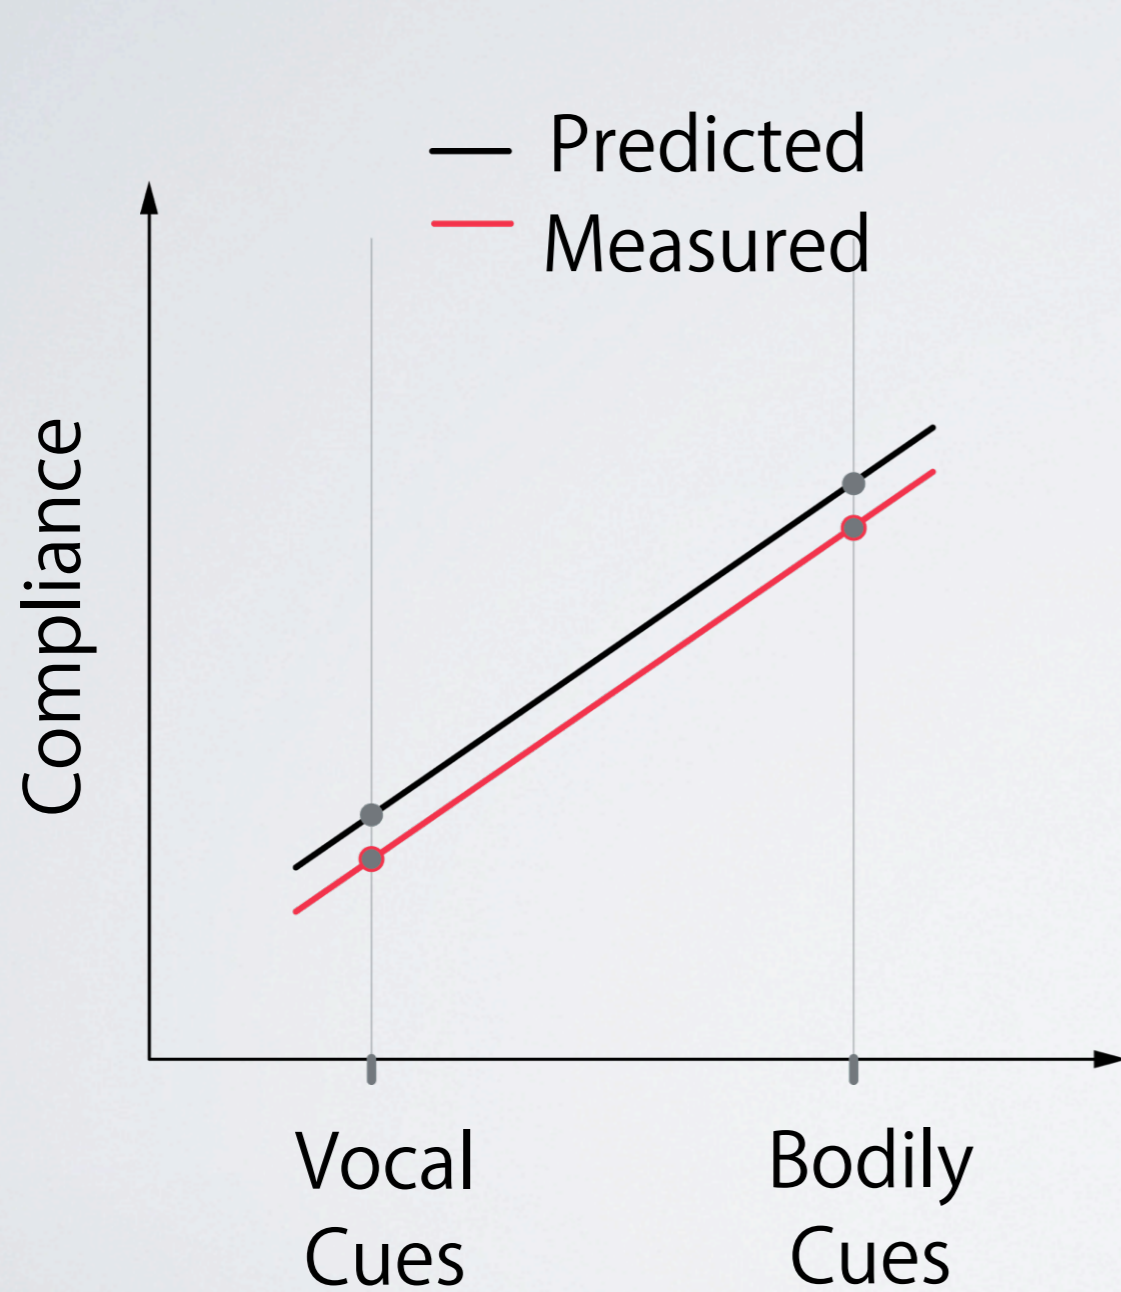

Familiarity with computers ($M = 7$, $SD = 0$)

Familiarity with robots ($M=3.67$, $SD = 1.71$)

Results: Hypothesis #1

Results: Hypothesis #2

Results: Hypothesis #3

Results: Subjective measurements

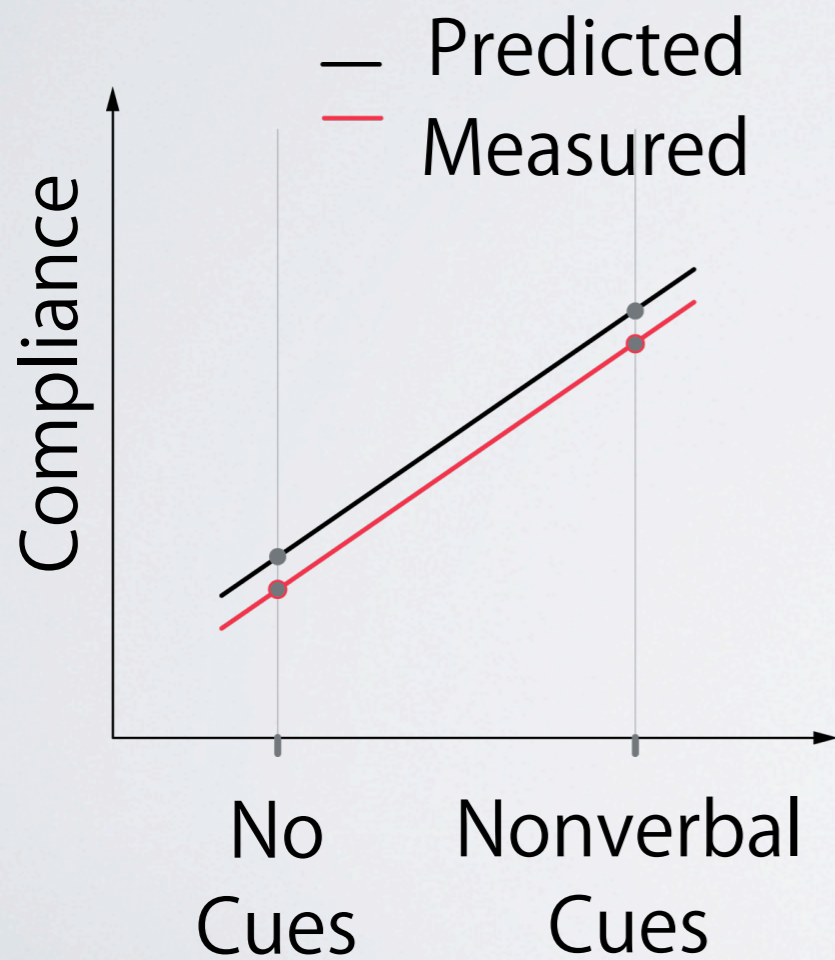

Men found the robot **more intelligent** when it employed **bodily cues**.

Women obtained **more task satisfaction** when the robot employed **vocal cues**.

Results

Hypothesis #1 and #2 **were supported**

Hypothesis #3 was **not** supported

Design Implications

Nonverbal immediacy plays a **key role** in determining persuasiveness of the robot

Bodily cues are **crucial** for a persuasive robot

Limitations

Compound conditions

Tease **apart** components in future work

Design of the robot

Investigate the effect of cues across **platforms**

Generalizability of experimental task

Explore a **variety** of tasks

Conclusion

Designed immediacy cues for a humanoid robot

Evaluated their effectiveness in persuasion

Found that **nonverbal immediacy** plays a key role in the **persuasiveness** of the robot

THANK YOU!
