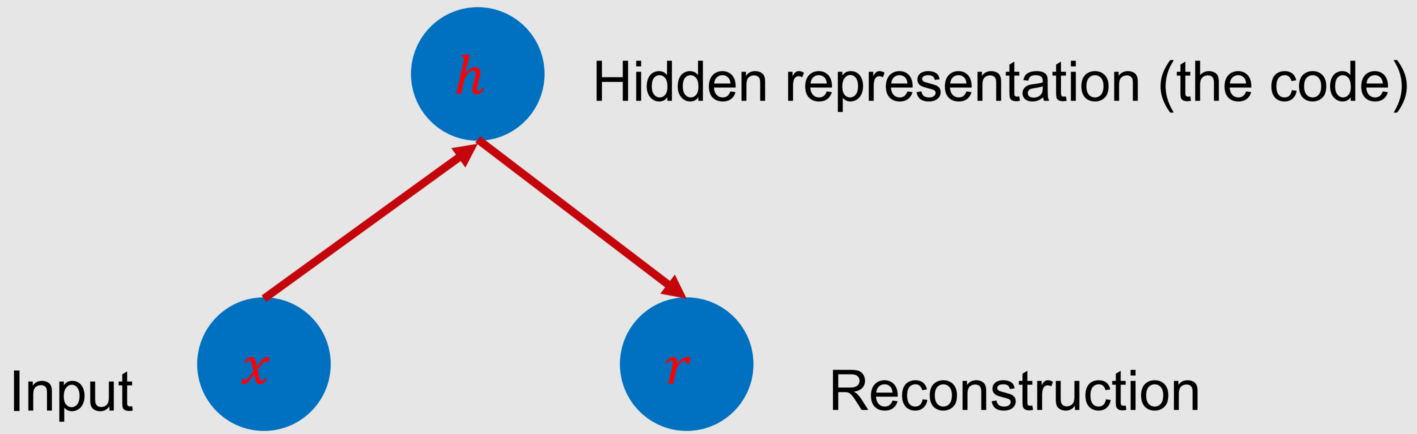
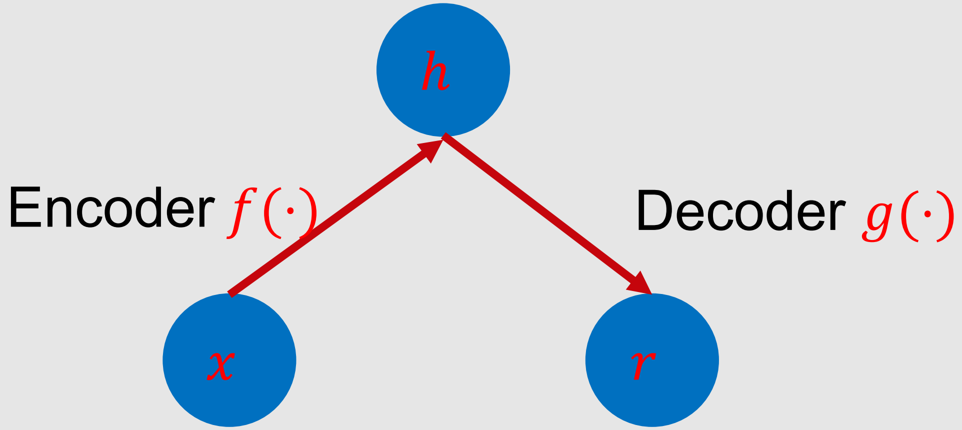
Autoencoder



Autoencoder

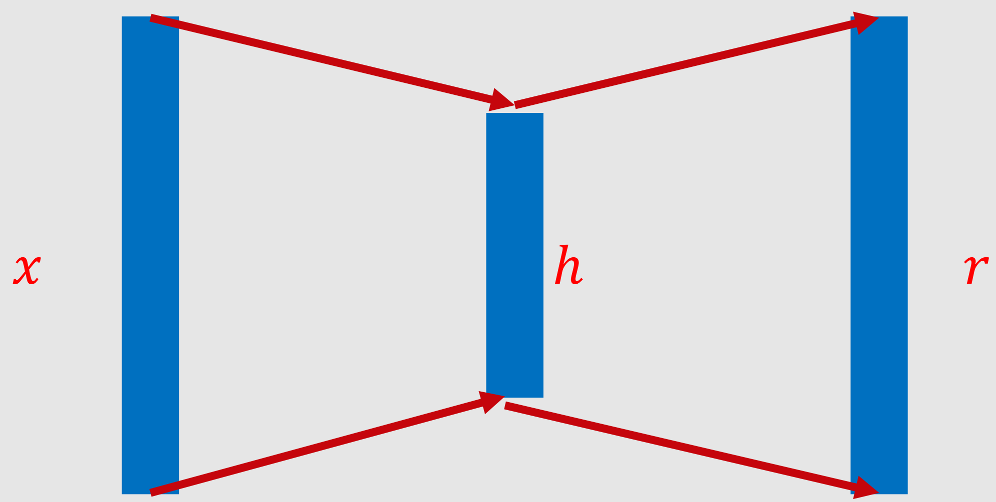


$$h = f(x), r = g(h) = g(f(x))$$

Undercomplete Autoencoder

- Constrain the code to have smaller dimension than the input
- Training: minimize a loss function

$$L(x,r) = L(x, g(f(x)))$$



Contrastive Learning

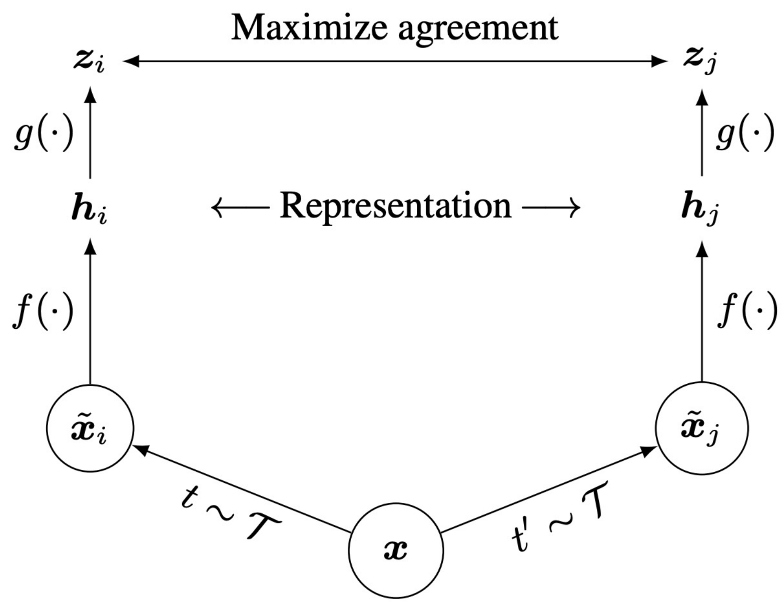


Figure 2. A simple framework for contrastive learning of visual representations. Two separate data augmentation operators are sampled from the same family of augmentations ($t \sim \mathcal{T}$ and $t' \sim \mathcal{T}$) and applied to each data example to obtain two correlated views. A base encoder network $f(\cdot)$ and a projection head $g(\cdot)$ are trained to maximize agreement using a contrastive loss. After training is completed, we throw away the projection head $g(\cdot)$ and use encoder $f(\cdot)$ and representation $\boldsymbol{h}$ for downstream tasks.
