

JavaScript

Lecture 17

CS 638 Web Programming

Overview of lecture

- ❑ On client side programming with JavaScript
- ❑ The core language
- ❑ Arrays
- ❑ Objects
- ❑ Variables, typing, and scoping

CS 638 Web Programming – Eistan & Kivolowitz

Why is JavaScript important?

- ❑ Web pages can contain JavaScript programs executed inside the browser
 - ❑ Supported by all major browsers
 - ❑ Microsoft's version called Jscript (the language is the same)
 - ❑ User may disable JavaScript due to security fears
 - ❑ This is default for some newer versions of Internet Explorer
- ❑ Client-side programming important for web because
 - ❑ Can promptly validate user input
 - ❑ Can update the web page without postback to server
 - ❑ Allows page to react to user actions other than pushing a "submit" button – more interactivity

CS 638 Web Programming – Eistan & Kivolowitz

What is JavaScript?

- ❑ Interpreted, object-oriented programming language with dynamic typing
 - ❑ Introduced by Netscape with Netscape 2.0 in 1995
 - ❑ Standardized as ECMAScript by ECMA (European Computer Manufacturers Association)
 - ❑ Not related to Java other than the name
- ❑ Tightly integrated with browser
 - ❑ Can handle many types of events generated by the normal interaction between user and browser
 - ❑ Can modify the internal objects based on which the browser renders the web page

CS 638 Web Programming – Eitan & Kivlowitz

Overview of lecture

- ❑ On client side programming with JavaScript
- ❑ The core language
- ❑ Arrays
- ❑ Objects
- ❑ Variables, typing, and scoping

CS 638 Web Programming – Eitan & Kivlowitz

Syntax similar to C++

- ❑ Statement block delimited by “{” and “}”
- ❑ Statements separated by ;
 - ❑ If single command per line, the ; can be left out
- ❑ Spaces, indentation have no semantic value
- ❑ Comments after // or between /* and */
- ❑ Identifiers contain \$, _, letters and digits
 - ❑ Cannot start with a digit
 - ❑ Variable names and keywords case sensitive

CS 638 Web Programming – Eistan & Kivowowitz

The if and switch statements

```
if (expression)
    statement

if (expression1)
    statement1
else if (expression2)
    statement2
...
else if (expressionk)
    statementk
else
    catch_all_statement

switch(n) {
    case 1: // if n==1
        statements1
        break;
    case 2: // if n==2
        statements2
        break;
    default: // otherwise
        statements3
}
```

❑ The case labels can be strings or even expressions

CS 638 Web Programming – Eistan & Kivowowitz

Loops

```
while (expression)
    statement

do
    statement
while (expression);

for (init; test; incr)
    statement

❑ break ends the innermost loop or switch
❑ continue jumps to the end of loop
❑ Labels can be used with nested loops

outer: for (i=0; i<5; i++) {
    for (j=0; j<5; j++) {
        a[i][j]++;
        if (a[i][j]<0)
            break outer;
    }
}
```

CS 638 Web Programming – Eistan & Kivowowitz

Functions and exceptions

❑ Defined as

```
function fname (args){  
    statements;  
}
```

❑ Invoked as

```
fname (args)
```

❑ Execution of function can be terminated with

```
return expression;
```

❑ To throw an exception

```
throw expression;
```

❑ To catch an exception

```
try{  
    statements1  
}catch (e){  
    statements2  
}finally{  
    statements3  
}
```

CS 638 Web Programming – Eistan & Kivowowitz

Overview of lecture

- ❑ On client side programming with JavaScript
- ❑ The core language
- ❑ Arrays
- ❑ Objects
- ❑ Variables, typing, and scoping

CS 638 Web Programming – Eistan & Kivowowitz

JavaScript Arrays

- ❑ Initialized by assigning an array literal `a = []` or by using constructor `a = new Array(1, 2, 3)`
- ❑ Elements' indices start with 0
- ❑ Can grow by assignment to inexistent element
- ❑ The `length` property gives length – `a.length`
- ❑ Arrays are sparse: `a = ['first']; a[99] = 'hundredth'` gives a two elements and a length of 100
- ❑ Special value `undefined` returned when inexistent element read – no exception thrown!

CS 638 Web Programming – Eistan & Kivolowitz

The screenshot shows a web browser window with the URL `http://www.cs.wisc.edu/~eistan/examples/39fasc/fibonacci.html`. The page displays the first 24 Fibonacci numbers in a list. To the right, the JavaScript code for generating this sequence is shown. The code includes a function `fibonacci(n)` that calculates the nth Fibonacci number using recursion, and a loop that prints the first 25 Fibonacci numbers to the document. The code is as follows:

```
<body>
<h1>Fibonacci numbers</h1>
<script language="JavaScript" type="text/javascript"><!--
f=[0,1];
function fibonacci(n){
  if(n>=f.length){
    f[n]=fibonacci(n-1)+fibonacci(n-2);
  }
  return f[n];
}
for (i=0;i<25;i++){
  document.write("F("+i+")="+fibonacci(i)+"<br/>");
}
--></script>
</body>
```

Useful array methods

- ❑ `join()` combines elements into a single string
 - ❑ Default separator `,` but can specify different one
 - ❑ `String.split()` method gives array of substrings
- ❑ `reverse()` reverses the order of elements
- ❑ `sort()` sorts elements in alphabetic order
- ❑ `slice(from, to)` returns elements between indices `from` and `to`
 - ❑ Negative "indices" give distance from end of array
- ❑ `pop()` deletes and returns last element
- ❑ `push(e)` adds `e` to end of array, returns new length
- ❑ `shift()` deletes and returns first element (shifts others)
- ❑ `unshift(e)` adds `e` to beginning of array (shifts others)

CS 638 Web Programming – Eistan & Kivolowitz

Overview of lecture

- ❑ On client side programming with JavaScript
- ❑ The core language
- ❑ Arrays
- ❑ Objects
- ❑ Variables, typing, and scoping

CS 638 Web Programming – Eistan & Kivolowitz

JavaScript objects

- ❑ Objects are little more than associative arrays
 - ❑ `obj.property` is same as `obj["property"]`
 - ❑ To create a new property, just assign to it
 - ❑ Object methods are properties whose values are functions
 - ❑ They can use the keyword `this` to refer to object
- ❑ Prototype-based inheritance (no classes)
 - ❑ Object `x` also inherits all properties of `x.prototype`
 - ❑ The constructor is just a function that uses the keyword `this` to access the new object
 - ❑ "Class properties" simulated with properties of constructor

CS 638 Web Programming – Eistan & Kivolowitz

C# vs. JavaScript objects

```
class Circle{
  private int x,y,radius;
  private const double pi=3.14;
  public Circle(int xc, int yc, int r){
    x=xc;y=yc;radius=r;
  }
  public double getArea(){
    return radius*radius*pi;
  }
  public double getDist(){
    return Math.Sqrt((double)(x*x+y*y));
  }
}

static void Main(string[] args){
  Circle c = new Circle(2,4,3);
  Console.WriteLine("Area is {0}", c.getArea());
  Console.WriteLine("Distance is {0}", c.getDist());
}

function Circle(xc,yc,r){
  this.x=xc;
  this.y=yc;
  this.radius=r;
}
Circle.prototype.getArea=function(){
  return this.radius*this.radius*Circle.pi;
}
Circle.prototype.getDist=function(){
  return Math.Sqrt(this.x*this.x+this.y*this.y);
}
Circle.pi=3.14;
c=new Circle(2,4,3);
document.write("Area is "+c.getArea()+"<br/>");
document.write("Distance is "+c.getDist()+"<br/>");
```

CS 638 Web Programming – Eistan & Kivolowitz

Traversing an object

The for/in loop

```
point={x:2,y:4};  
for (p in point)  
    document.write(p);
```

- ❑ Does not go through inherited properties
- ❑ For arrays, the for/in loop goes through the indices of elements

The in operator

```
point={x:2,y:4};  
has_x="x" in point;  
has_z="z" in point;
```

- ❑ Checks inherited properties
- ❑ For arrays, the in operator tests whether the element with the given index exists

CS 638 Web Programming – Eistan & Kivlowitz

Overview of lecture

- ❑ On client side programming with JavaScript
- ❑ The core language
- ❑ Arrays
- ❑ Objects
- ❑ Variables, typing, and scoping

CS 638 Web Programming – Eistan & Kivlowitz

Most important types

- ❑ Numbers – 15 or 0xff or 5.19 or 5.7e15
- ❑ Strings – 'abc' or "abc" or 'a'\'\nb'
 - ❑ Concatenation using +
- ❑ Booleans – true or false
- ❑ Functions – sq=function(x){return x*x;}
- ❑ Arrays – [1,2,3] or ['abc', [2,5], 8]
- ❑ Objects – {x:2,y:3} or {color:"blue",age:5}
 - ❑ No classes – all objects are of the same type
 - ❑ Functions and arrays are also objects

CS 638 Web Programming – Eistan & Kivlowitz

JavaScript variables

- ❑ All variables untyped – `x=4 ; x='xyz' ; x= []`
- ❑ Variables are either global or local to function
 - ❑ No block scope!!!
- ❑ Variables are declared using the `var` keyword
 - ❑ Assigning to unused name implicitly declares it as a global
 - ❑ Reading an undeclared variable causes an error

Types	Passed/copied by	Comparison
boolean, number	value	value
string	immutable	value
object (arrays, functions)	reference	reference

CS 638 Web Programming – Eistan & Kivolowitz

Some JavaScript operators

Operator(s)	Operand type(s)	Operation performed
<code>.</code>	object, identifier	Property access
<code>[]</code>	array, integer	Array index
<code>()</code>	function, argument	Function call
<code>++,--</code>	lvalue	Increment, decrement
<code>!</code>	boolean	Logical complement
<code>*,/,%</code>	number, number	Multiplication, division, remainder
<code>+, -</code>	number, number	Addition, subtraction
<code><<, >>, >>></code>	integer, integer	Shift operations
<code><, <=, >, >=</code>	num./string, num./string	Comparisons (numeric or lexicographic)
<code>==, ===, !=, !==</code>	any, any	(in)equality, (non)identity
Bitwise operators, boolean operators, conditional operator		
<code>=</code>	lvalue, any	Assignment
<code>+=, -=, *=, ...</code>	lvalue, any	Assignment with operation

CS 638 Web Programming – Eistan & Kivolowitz
