

CS 536 Announcements for Monday, March 11, 2024

Programming Assignment 3 – due Friday, March 15

Midterm 2 – Thursday, March 21

Last Time

- review grammar transformations
- building a predictive parser
- FIRST and FOLLOW sets

Today

- review parse table construction
- predictive parsing and syntax-directed translation

Next Time

- static semantic analysis

Recap of where we are

Predictive parser builds the parse tree top-down

- 1 token lookahead
- parse-selector table
- stack tracking current parse tree's frontier

Building the parse table – given production $lhs \rightarrow rhs$, determine what terminals would lead us to choose that production

ie figure out T so that $table[lhs][T] = rhs$

$$FIRST(\alpha) = \{ T \mid (T \in \Sigma \wedge \alpha \Rightarrow^* T\beta) \vee (T = \epsilon \wedge \alpha \Rightarrow^* \epsilon) \}$$

$$FOLLOW(a) = \{ T \mid (T \in \Sigma \wedge s \Rightarrow^* aT\beta) \vee (T = EOF \wedge s \Rightarrow^* a) \}$$

Current token: D

$S \rightarrow aC$
 $\quad \quad \quad | ba$

Look at $FIRST(aC)$
& $FIRST(ba)$

If D is in neither
& $ba \Rightarrow^* \epsilon$, then
look at $FOLLOW(ba)$

FIRST and FOLLOW sets

FIRST(α) for $\alpha = y_1 y_2 \dots y_k$

Add FIRST(y_1) - $\{ \epsilon \}$

If ϵ is in FIRST($y_{1 \text{ to } i-1}$), add FIRST(y_i) - $\{ \epsilon \}$

If ϵ is in all RHS symbols, add ϵ

FOLLOW(a) for $x \rightarrow \alpha a \beta$

If a is the start, add EOF

Add FIRST(β) - $\{ \epsilon \}$

Add FOLLOW(x) if ϵ is in FIRST(β) or β is empty

Note that

FIRST sets

- only contain alphabet terminals and ϵ
- defined for arbitrary RHS and nonterminals
- constructed by started at the beginning of a production

FOLLOW sets

- only contain alphabet terminals and EOF
- defined for nonterminals only
- constructed by jumping into production

↳ at beginning of rhs (for FIRST(lhs))

Putting it all together

- Build FIRST sets for each nonterminal
- Build FIRST sets for each production's RHS
- Build FOLLOW sets for each nonterminal
- Use FIRST and FOLLOW sets to fill parse table for each production

Building the parse table

```
for each production  $x \rightarrow \alpha$  {  
  for each terminal  $T$  in FIRST( $\alpha$ ) {  
    put  $\alpha$  in table[ $x$ ][ $T$ ]  
  }  
  if  $\epsilon$  is in FIRST( $\alpha$ ) {  
    for each terminal  $T$  in FOLLOW( $x$ ) {  
      put  $\alpha$  in table[ $x$ ][ $T$ ]  
    }  
  }  
}
```

Example

CFG

$s \rightarrow aC \mid ba$
 $a \rightarrow AB \mid Cs$
 $b \rightarrow D \mid \epsilon$

FIRST and FOLLOW sets

	FIRST sets	FOLLOW sets
s	A, C, D	EOF, FOLLOW(a) C
a	A, C	C, EOF
b	D, ϵ	A, C
s \rightarrow aC	A, C	
s \rightarrow ba	D, A, C	
a \rightarrow AB	A	
a \rightarrow Cs	C	
b \rightarrow D	D	
b \rightarrow ϵ	ϵ	

Parse table

for each production $x \rightarrow \alpha$

for each terminal T in FIRST(α)
put α in table[x][T]

if ϵ is in FIRST(α)

for each terminal T in FOLLOW(x)
put α in table[x][T]

→ not LL(1)

	A	B	C	D	EOF
s	aC, ba		aC, ba	ba	
a	AB		Cs		
b	ϵ		ϵ	D	

Example

CFG

$$s \rightarrow (s) \mid \{s\} \mid \epsilon$$

FIRST and FOLLOW sets

	FIRST sets	FOLLOW sets
s	$(\{ \epsilon \}$	$\text{EOF }) \}$
$s \rightarrow (s)$	$($	
$s \rightarrow \{s\}$	$\{$	
$s \rightarrow \epsilon$	ϵ	

Parse table

for each production $x \rightarrow \alpha$

for each terminal T in $\text{FIRST}(\alpha)$

put α in $\text{table}[x][T]$

if ϵ is in $\text{FIRST}(\alpha)$

for each terminal T in $\text{FOLLOW}(x)$

put α in $\text{table}[x][T]$

	$($	$)$	$\{$	$\}$	EOF
s	(s)	ϵ	$\cdot \{s\}$	ϵ	ϵ

Parsing and syntax-directed translation

Recall syntax-directed translation (SDT)

To translate a sequence of tokens

- build the parse tree
- use translation rules to compute the translation of each non-terminal in the parse tree, bottom up
- the translation of the sequence is the translation of the parse tree's root non-terminal

Goal translation: evaluate expression

CFG:

expr \rightarrow expr + term
| term

term \rightarrow term * factor
| factor

factor \rightarrow INTLIT
| (expr)

SDT rules:

expr₁.trans = expr₂.trans + term.trans
expr.trans = term.trans

term₁.trans = term₂.trans * factor.trans
term.trans = factor.trans

factor.trans = INTLIT.value
factor.trans = expr.trans

The LL(1) parser never needed to explicitly build the parse tree
– it was implicitly tracked via the stack.

Instead of building parse tree, give parser a second, semantic stack
– holds translations of nonterminals

SDT rules are converted to actions

- pop translations of RHS nonterminals*
- push computed translation of LHS nonterm*

CFG:

expr \rightarrow expr + term
| term

term \rightarrow term * factor
| factor

factor \rightarrow INTLIT
| (expr)

SDT actions:

tTrans = pop; eTrans = pop; push(eTrans + tTrans)

~~tTrans = pop; push(tTrans)~~

fTrans = pop; tTrans = pop; push(tTrans * fTrans)

~~fTrans = pop; push(fTrans)~~

push(INTLIT.value)

~~eTrans = pop; push(eTrans)~~

translations are popped R-to-L

useless rules

Parsing and syntax-directed translation (cont.)

Augment the parsing algorithm

- number the actions *work*
- when RHS of production is pushed onto symbol stack, include the actions
- when action is the top of symbol stack, pop & perform the action

CFG:

SDT actions:

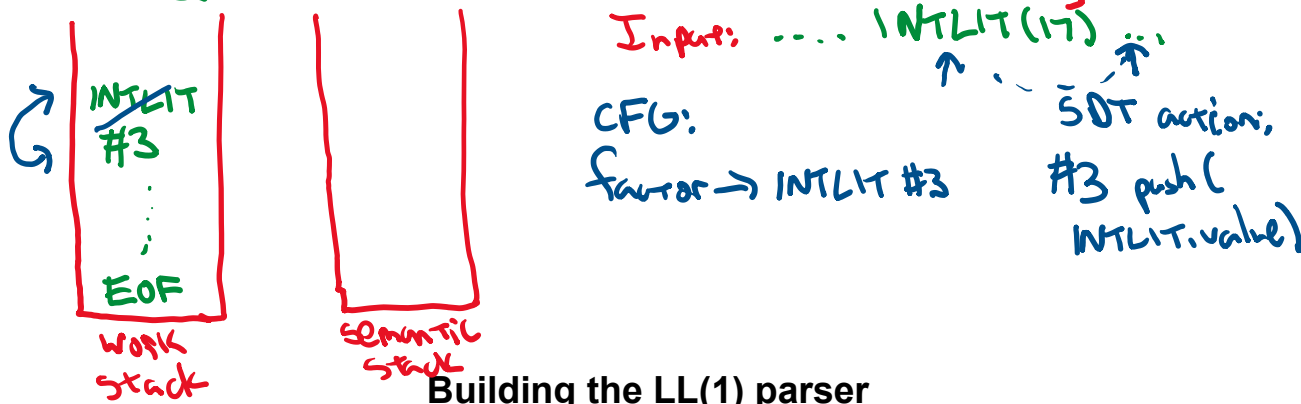

expr \rightarrow expr + term #1 #1 tTrans = pop; eTrans = pop; push(eTrans + tTrans)
 | term

term \rightarrow term * factor #2 #2 fTrans = pop; tTrans = pop; push(tTrans * fTrans)
 | factor

factor \rightarrow INTLIT #3 #3 push(INTLIT.value)
 | (expr)

Placing the action numbers in the productions

- action numbers go
 - after their corresponding non-terminals
 - before their corresponding terminal *why? Consider putting it after*

Building the LL(1) parser

1) Define SDT using the original grammar

- write translation rules
- convert translation rules to actions that push/pop using semantic stack
- incorporate action #s into grammar rules

2) Transform grammar to LL(1)

- treating action #s like terminals

3) Compute FIRST and FOLLOW sets

- treating action #s like ϵ

4) Build the parse table

Example SDT on transformed grammar

Original CFG:

$\text{expr} \rightarrow \text{expr} + \text{term} \#1$
 $\quad \quad | \text{term}$
 $\text{term} \rightarrow \text{term} * \text{factor} \#2$
 $\quad \quad | \text{factor}$
 $\text{factor} \rightarrow \#3 \text{ INTLIT}$
 $\quad \quad | (\text{expr})$

Transformed CFG:

$\text{expr} \rightarrow \text{term} \text{expr}'$
 $\text{expr}' \rightarrow + \text{term} \#1 \text{expr}'$
 $\quad \quad | \epsilon$
 $\text{term} \rightarrow \text{factor} \text{term}'$
 $\text{term}' \rightarrow * \text{factor} \#2 \text{term}'$
 $\quad \quad | \epsilon$
 $\text{factor} \rightarrow \#3 \text{ INTLIT} | (\text{expr})$

Transformed CFG:

$\text{expr} \rightarrow \text{term} \text{expr}'$
 $\text{expr}' \rightarrow + \text{term} \#1 \text{expr}' | \epsilon$
 $\text{term} \rightarrow \text{factor} \text{term}'$
 $\text{term}' \rightarrow * \text{factor} \#2 \text{term}' | \epsilon$
 $\text{factor} \rightarrow \#3 \text{ INTLIT} | (\text{expr})$

SDT actions:

$\#1 : \text{tTrans} = \text{pop};$
 $\quad \text{eTrans} = \text{pop};$
 $\quad \text{push}(\text{eTrans} + \text{tTrans})$
 $\#2 : \text{fTrans} = \text{pop};$
 $\quad \text{tTrans} = \text{pop};$
 $\quad \text{push}(\text{tTrans} * \text{fTrans})$
 $\#3 : \text{push}(\text{INTLIT.val})$

Parse table

	+	*	()	INTLIT	EOF
expr			term expr'		term expr'	
expr'	+ term #1 expr'			ϵ		ϵ
term			factor term'		factor term'	
term'	ϵ	* factor #2 term'		ϵ		ϵ
factor			(expr)		#3 INTLIT	

Input: $5 + 3 * 2 \text{ EOF}$
 $\uparrow \uparrow \uparrow \uparrow \uparrow \uparrow$
 $\#2 : \text{fTrans} = 2$
 $\quad \text{tTrans} = 3 \quad \rightarrow 3 * 2 = 6$
 $\#1 : \text{tTrans} = 6$
 $\quad \text{eTrans} = 5 \quad \rightarrow 5 + 6 = 11$

What about ASTs?

Push and pop AST nodes on the semantic stack
 Keep references to nodes that we pop

Original CFG:

$\text{expr} \rightarrow \text{expr} + \text{term} \#1$
 $\quad \quad \quad | \text{term}$
 $\text{term} \rightarrow \#2 \text{ INTLIT}$

Transformed CFG:

$\text{expr} \rightarrow \text{term} \text{expr}'$
 $\text{expr}' \rightarrow + \text{term} \#1 \text{expr}'$
 $\quad \quad \quad | \epsilon$
 $\text{term} \rightarrow \#2 \text{ INTLIT}$

SDT actions:

#1 : tTrans = pop;
 eTrans = pop;
 push(new PlusNode (eTrans, tTrans))
 #2 : push(new InLitNode (INTLIT.value))

Parse table:

	INTLIT	+	EOF
expr	term expr'		
expr'		+ term #1 expr'	ϵ
term	#2 INTLIT
