## HW2 Solutions (CS552 Spring 2013)

Grade distribution: (Total: 100)

- Verilog submission of problems 1) and 2) carry 25 points each(Total: 50 points)
- Written part of problem 1) and 2) carry 5 points (Total: 10 points)
- Written part of problems 3) through 14) ( only four are graded) carry 10 points each (Total: 40 points)

## Grading of verilog submission:

Total points for each problem :25

- Points for compiling design : 5
- Points for functional tests: 20 (1 point deducted for each failure out of 50 random tests)
- Penalty for incorrect directory structure: -5
- Penalty for missing files: (50\% of points scored for the problem)
- Penalty for vcheck failures: (50\% of points scored for the problem)

Grading of written part:
-written part of problems 1) and 2) - 5 points each
-Problems 3), 5), 8) and 9) - 10 points each

## Problem 14

objdump is a program for displaying various information about object
files. For instance, it can be used as a disassembler to view executable in assembly form. It is part of the GNU binutils for fine-grained control over executable and other binary data.

400474 push \%rbp
400475 mov \%rsp,\%rbp //Setting up stack registers
400478 movl \$0x0,-0x4(\%rbp) //Initialise sum, -0x4(\%rbp)

| 40047 f | movl \$0x0,-0x8(\%rbp) | //Initialize i |
| :--- | :--- | :--- |
| 400486 | jmp 400492<main+0x1e> | //check the loop condition before first iteration |
| 400488 | mov -0x8(\%rbp),\%eax | //load value of i into register \%eax |
| 40048 b | add \%eax, -0x4(\%rbp) | //add i to sum |
| 40048 e | addl \$0x1,-0x8(\%rbp) | //increment i |
| 400492 | cmpl \$0x17, -0x8(\%rbp) | //compare i to 23 (ie, 0x17) |
| 400496 | jle 400488 <main+0x14> | //if i<=23, go to beginning of loop |
| 400498 | mov -0x4(\%rbp), \%eax | //Keep value of sum in \%eax before returning |
| $40049 b$ | leaveq |  |
| 40049 c | retq |  |
| 40049 d | nop |  |
| 40049 e | nop |  |
| 40049 f | nop |  |

With -O3:
mov \$0x114, \%eax
retq
The compiler optimizes the loop and determines the sum without executing the loop. Note that $0 \times 114$ or 276 in decimal is the sum of integers from 0 to 23 !

The other instructions set up context to start the program and are part of standard libraries to load a program.
