Today

- Eyes
- Cameras

Why can we see?

Kimber, D.C.; C.E. Gray, and C.E. Stackpole. (1966).
Anatomy and Physiology. MacMillan Co., NY. pg.335.

Visible Light and Beyond

Cones and Rods

Kimber, D.C.; C.E. Gray, and C.E. Stackpole. (1966).
Anatomy and Physiology. MacMillan Co., NY. pg.335.

Photomicrographs at increasing distances from the fovea. The large cells are cones; the small ones are rods.

Color Vision

Kimber, D.C.; C.E. Gray, and C.E. Stackpole. (1966).
Anatomy and Physiology. MacMillan Co., NY. pg.335.

Rods

rod-shaped
highly sensitive
operate at night
gray-scale vision

Photomicrographs at increasing distances from the fovea. The large cells are cones; the small ones are rods.

Cones

cone-shaped
less sensitive
operate in high light
color vision

Color Vision

Three kinds of cones:

Cone mosaic

Electromagnetic Spectrum

Human Luminance Sensitivity Function

Lightness contrast

- Also know as
 - Simultaneous contrast
 - Color contrast (for colors)

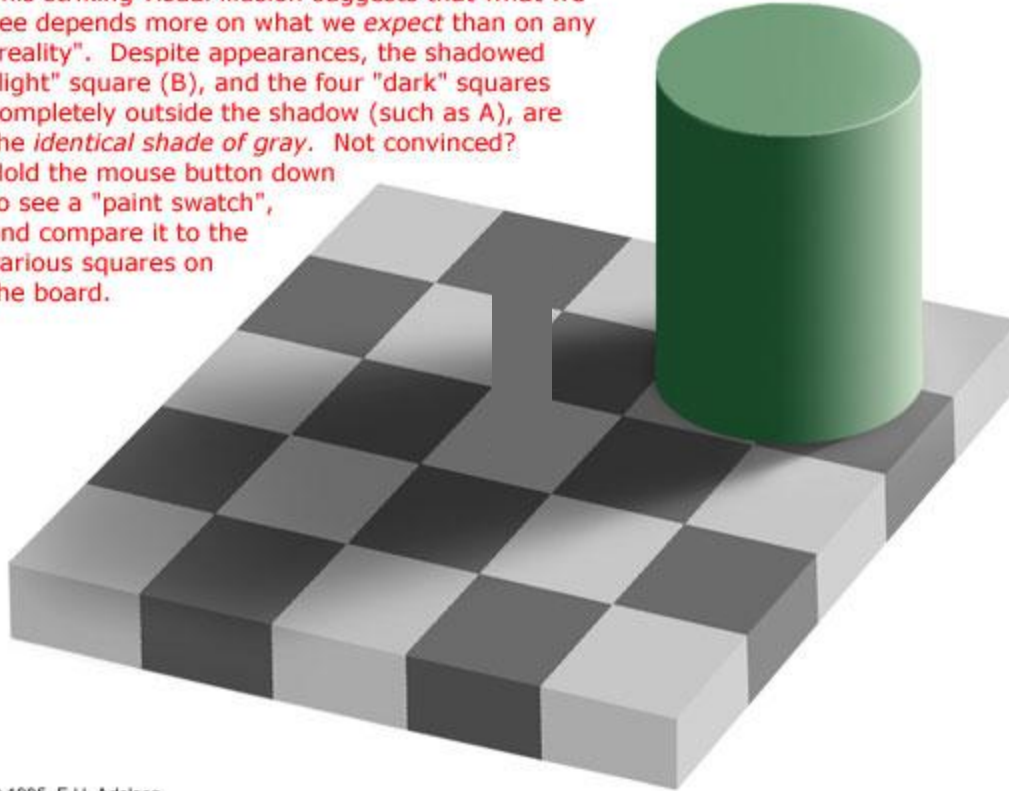

Why is it important?

- This phenomenon helps us maintain a consistent mental image of the world, under dramatic changes in illumination.

But, It causes Illusion as well

- http://www.michaelbach.de/ot/lum_white-illusion/index.html

This striking visual illusion suggests that what we see depends more on what we *expect* than on any "reality". Despite appearances, the shadowed "light" square (B), and the four "dark" squares completely outside the shadow (such as A), are the *identical shade of gray*. Not convinced? Hold the mouse button down to see a "paint swatch", and compare it to the various squares on the board.

Noise

- Noise can be thought as randomness added to the signal
- The eyes are relatively insensitive to noise.

Vision vs. Graphics

Computer Graphics

Modelling

Simulation &
Rendering

Image

Computer Vision

Image Capture

- Let's design a camera
 - Idea 1: put a piece of film in front of an object
 - Do we get a reasonable image?

Pinhole Camera

- Add a barrier to block off most of the rays
 - This reduces blurring
 - The opening known as the **aperture**
 - How does this transform the image?

Camera Obscura

- The first camera
 - 5th B.C. Aristotle, Mozi (Chinese: 墨子)
 - How does the aperture size affect the image?

Shrinking the aperture

- Why not make the aperture as small as possible?
 - Less light gets through
 - *Diffraction* effects...

Shrinking the aperture

2 mm

1 mm

0.6mm

0.35 mm

0.15 mm

0.07 mm

Shrinking the aperture

Sharpest image is obtained when:

$$d = 2 \sqrt{f\lambda}$$

d is diameter,
 f is distance from hole to film
 λ is the wavelength of light,
all given in metres.

Example: If $f = 50\text{mm}$,

$\lambda = 600\text{nm}$ (red),

$d = 0.36\text{mm}$

2 mm

Impressive Images

Jerry Vincent's Pinhole Photos

What's wrong with Pinhole Cameras?

- Low incoming light => Long exposure time => Tripod

KODAK Film or Paper	Bright Sun	Cloudy Bright
TRI-X Pan	1 or 2 seconds	4 to 8 seconds
T-MAX 100 Film	2 to 4 seconds	8 to 16 seconds
KODABROMIDE Paper, F2	2 minutes	8 minutes

What's wrong with Pinhole Cameras

People are ghosted

What's wrong with Pinhole Cameras

People become ghosts!

Pinhole Camera Recap

- Pinhole size (aperture) must be “very small” to obtain a clear image.
- However, as pinhole size is made smaller, less light is received by image plane.
- If pinhole is comparable to wavelength of incoming light, ***DIFFRACTION*** effects blur the image!
- Require long exposure time

What's the solution?

- Lens

- A lens focuses light onto the film
 - There is a specific distance at which objects are “in focus”
 - other points project to a “circle of confusion” in the image
 - Changing the shape of the lens changes this distance

Demo!

Film camera

Film camera

Still Life, Louis Jaques Mande Daguerre, 1837

Before Film was invented

Lens Based Camera Obscura, 1568

Silicon Image Detector

Silicon Image Detector, 1970

Digital camera

- A digital camera replaces film with a sensor array
- Each cell in the array is a light-sensitive diode that converts photons to electrons

SLR (Single-Lens Reflex)

- Reflex (R in SLR) means that we see through the same lens used to take the image.
- Not the case for compact cameras

Exposure

- Two main parameters:
 - Aperture (in f stop)
 - shutter speed (in fraction of a second)

Depth of Field

Large aperture opening

Small aperture opening

Changing the aperture size affects depth of field. A smaller aperture increases the range in which the object is approximately in focus

See <http://www.photonhead.com/simcam/>

Effects of shutter speeds

- Slower shutter speed => more light, but more motion blur

1/15 s

1/60 s

1/250 s

1/1000 s

- Faster shutter speed freezes motion

Color

So far, we've only talked about monochrome sensors. Color imaging has been implemented in a number of ways:

- Field sequential
- Multi-chip
- Color filter array
- X3 sensor

Field sequential

Field sequential

Color filter array

Mosaic Capture

In conventional systems, color filters are applied to a single layer of photodetectors in a tiled mosaic pattern.

The filters let only one wavelength of light - red, green or blue - pass through to any given pixel, allowing it to record only one color.

As a result, mosaic sensors capture only 25% of the red and blue light, and just 50% of the green.
