# ECE/CS 252: INTRODUCTION TO COMPUTER ENGINEERING <br> UNIVERSITY OF WISCONSIN—MADISON 

Prof. Gurindar S. Sohi
TAs: Newsha Ardalani and Rebecca Lam

Midterm Examination 3
In Class (50 minutes)
Friday, November 18, 2011
Weight: 17.5\%

## NO: BOOK(S), NOTE(S), CALCULATORS OF ANY SORT.

This exam has pages, including one page for the LC3 Instruction Set and two blank pages at the end. Plan your time carefully, since some problems are longer than others. You must turn in pages 1 through ?.

LAST NAME:

## Problem 1 (2 Points)

When a computer executes an instruction, the state of the computer is changed as a result of that execution. Is there any difference in the state of LC-3 computer as a result of executing instruction 1 below vs executing instruction 2 below? Explain. We can assume the state of the LC-3 computer before execution is the same in both cases.

Instruction 1: 0001000000100000 ; RO <- RO + \#0
Instruction 2: 0000111000000000 ; Branch to incremented PC if any of $\mathrm{P}, \mathrm{Z}$ or N is set

Instruction 1 sets the condition code but instruction 2 does not.

## Problem 2 (4 Points)

A program wishes to load a value from memory into R1, and on the basis of the value loaded, execute code starting at x3040 if the value loaded is positive, executing code starting at at x3080 if the value is negative, or execute code starting at location x3003 if the value loaded is zero. The first instruction of this program (load a value into R1) is shown in x3000.

Your job: Write the instructions for locations x3001 and x3002.

| ADDRESS | ISA INSTRUCTION | COMMENT |
| :---: | :---: | :---: |
| x3000 | 0010001011111111 | Load a value from memory location x3100 into R1 |
| x3001 | $\begin{array}{lllll} 0000 & 001 & 000111110 & \text { or } \\ 0000 & 100 & 001111110 \end{array}$ | BRp x3040 or BRn x3080 |
| x3002 | $\begin{aligned} & 0000100001111101 \text { or } \\ & 0000001000111101 \end{aligned}$ | Brn x3080 or Brp x 3040 |

## Problem 3 (6 Points)

Answer the following short answer questions with no more than 4 sentences each.
a. (1 point) Suppose the number of opcodes for the LC-3 increases to 64. If the instruction size stays the same, how is the range of addresses a BR instruction can access affected?
$\log _{2}(64)=6$ so our opcode field expands by two bits. This means that our PCoffset becomes 7 bits, meaning the PCoffset range becomes $-2^{7-1}$ to $2^{7-1}-1$. Thus we can branch to PC $+1-2^{6}$ to PC $+2^{6}$
b. (1 point) Suppose the number of registers for the LC-3 is decreased by half. If the instruction size stays the same, how is the AND instruction (register mode) changed?

If we decrease the number of registers in the LC-3 then we will need 1 less bit per register field. This means our DR, SR1, SR2 fields will be 2 bits long. If we assume bit 5 is still the bit we use to indicate register or immediate mode then we will have three additional unused bits.
c. (2 points)Write two of the three constructs that comprise the systematic decomposition model and define them.

Sequential: Do task 1 and then task 2
Conditional: If the condition is true do task 1, else do task 2

Iterative: Do a task repeatedly while condition is true
d. (2 points) Write two of the three different types of program errors and define them.

Syntax: Typing error that results in an illegal operation
Logic: Program is legal, but results don't match the problem statement

Data: Input data is different from what is expected

## Problem 4 (6 Points)

An LC-3 program is located in memory locations $\times 3000$ to $\times 3006$. It starts executing at $\times 3000$. If we keep track of all values loaded into the MAR as the program executes, we will get a sequence that starts as follows. Such a sequence is referred to as a trace.

We have shown below some of the bits stored in locations $x 3000$ to $\times 3006$. Your job is to fill in each blank space with a 0 or 1, as appropriate.

| $x 3000$ | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $x 3001$ | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 |
| $x 3002$ | 1 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| $x 3003$ | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 |
| $x$ | 1 | $x$ | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 1 | 0 |  |  |  |  |  |
| $x 3004$ | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 1 |
| $x 3005$ | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 |
| $x 3006$ | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

Problem 5 (6 Points)
Given the following LC-3 program, express the final value of R1 in terms of the initial value of R2 after execution of the last instruction. Show comments for each line.

| Address | Instruction |
| :--- | :--- |
| x3000 | 0101011011100000 R3 $~$ R3 AND 0 |
| x3001 | 0001011011100011 R3 = R3 + 3, R3 = 3 |
| x3002 | 0001001010100000 R1 = R2 + 0 |
| x3003 | 0001001001000001 R1 = R1 + R1 (Begin loop) At end of loop, R1 = R2 << 3 |
| x3004 | 0001011011111111 R3 = R3 - 1 |
| x3005 | 0000001111111101 If R3 > 0, branch to 0x3003 |
| x3006 | 1001010010111111 R2 = NOT (R2) |
| x3007 | 0001001001000010 R1 = R1 + NOT (R2). |
| x3008 | 1111000000100101 HALT |

$R 1=R 2 \ll 3+\operatorname{NOT}(R 2)$ or R1 $=R 2 * 2^{\wedge} 3+\operatorname{NOT}(R 2)$

## Problem 6 (6 points)

Suppose we wish to write a program that performs a deletion of one element from a list of elements sorted in ascending order without duplicates, where the element to be deleted is stored in R1. The program works as follows:

Knowing that the element to be deleted is in R1, we load the first value of the list into R2. If the value of R2 is less than R1, we load the next value in the list into R2, and we keep doing this while R2 is less than R1. If the value of R2 is greater than R1, we halt the program. If the value of R2 is equal to R1, we load the next value in the list into the memory location that R2 used to be in. And we keep doing this for the rest of the list.

Example: The following table shows the list before and after $x 0003$ is deleted from the list

| Address | Initial Value | Final Value |
| :--- | :--- | :--- |
| $x 4500$ | $x 0001$ | $x 0001$ |
| $x 4501$ | $x 0002$ | $x 0002$ |
| $x 4502$ | $x 0003$ | $x 0004$ |
| $x 4503$ | $x 0004$ | $x 0005$ |
| $x 4504$ | $x 0005$ | $x 0006$ |
| $x 4505$ | $x 0006$ | unknown |

Fill in the six missing blanks in the following flow chart.
