

#### CS 540 Introduction to Artificial Intelligence Unsupervised Learning II

Fred Sala University of Wisconsin-Madison

Feb 23, 2021

#### Announcements

- Homeworks:
  - HW3 recap
  - HW4 released: clustering
- Class roadmap:

Thursday, Feb 18	ML Intro	
Tuesday, Feb 23	ML Unsupervised I	
Thursday, Feb 25	ML Linear Regression	ſ
Tuesday, March 2	ML: Naïve Bayes, Recap	J

# Outline

- Finish up Other Clustering Types
  - Graph-based, cuts, spectral clustering
- Unsupervised Learning: Visualization
  - t-SNE, algorithm, example, vs. PCA
- Unsupervised Learning: Density Estimation
  - Kernel density estimation: high-level intro

# Other Types of Clustering

**Graph**-based/proximity-based

- Recall: Graph G = (V,E) has vertex set V, edge set E.
  - Edges can be weighted or unweighted
  - Encode similarity

Don't need vectors here

Just edges (and maybe weights)

### **Graph-Based Clustering**

**Want:** partition V into  $V_1$  and  $V_2$ 

- Implies a graph "cut"
- One idea: minimize the weight of the cut
  - Downside: might just cut of one node
  - Need: "balanced" cut

#### **Partition-Based Clustering**

**Want:** partition V into V<sub>1</sub> and V<sub>2</sub>

- Just minimizing weight isn't good... want **balance!**
- Approaches:

$$\operatorname{Cut}(V_1, V_2) = \frac{\operatorname{Cut}(V_1, V_2)}{|V_1|} + \frac{\operatorname{Cut}(V_1, V_2)}{|V_2|}$$
$$\operatorname{NCut}(V_1, V_2) = \frac{\operatorname{Cut}(V_1, V_2)}{\sum_{i \in V_1} d_i} + \frac{\operatorname{Cut}(V_1, V_2)}{\sum_{i \in V_2} d_i} \underbrace{\leftarrow}_{\text{Sum of edge}}$$

weights at vertex

# **Partition-Based Clustering**

#### How do we compute these?

- Hard problem  $\rightarrow$  heuristics
  - Greedy algorithm
  - "Spectral" approaches
- Spectral clustering approach:
   Adjacency matrix

 $\begin{bmatrix} 0 & 0 & 0 & 1 & 1 \\ 0 & 0 & 1 & 1 & 0 \\ 0 & 1 & 0 & 0 & 0 \\ 1 & 1 & 0 & 0 & 1 \\ 1 & 0 & 0 & 1 & 0 \end{bmatrix}$ A =

#### **Partition-Based Clustering**

- Spectral clustering approach:
  - Adjacency matrix
  - **Degree** matrix

$$D = \begin{bmatrix} 2 & 0 & 0 & 0 & 0 \\ 0 & 2 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 3 & 0 \\ 0 & 0 & 0 & 0 & 2 \end{bmatrix} \quad A = \begin{bmatrix} 0 & 0 & 0 & 1 & 1 \\ 0 & 0 & 1 & 1 & 0 \\ 1 & 1 & 0 & 0 & 1 \\ 1 & 0 & 0 & 1 & 0 \end{bmatrix}$$

Spectral clustering approach:

 1. Compute Laplacian L = D – A
 (Important tool in graph theory)

$$L = \begin{bmatrix} 2 & 0 & 0 & 0 & 0 \\ 0 & 2 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 3 & 0 \\ 0 & 0 & 0 & 0 & 2 \end{bmatrix} - \begin{bmatrix} 0 & 0 & 0 & 1 & 1 \\ 0 & 0 & 1 & 1 & 0 \\ 1 & 1 & 0 & 0 & 1 \\ 1 & 0 & 0 & 1 & 0 \end{bmatrix} = \begin{bmatrix} 2 & 0 & 0 & -1 & -1 \\ 0 & 2 & -1 & -1 & 0 \\ 0 & -1 & 1 & 0 & 0 \\ -1 & -1 & 0 & 3 & -1 \\ -1 & 0 & 0 & -1 & 2 \end{bmatrix}$$
Degree Matrix
Adjacency Matrix
Laplacian

3

- Spectral clustering approach:
  - 1. Compute Laplacian L = D A
  - 2. Compute *k* smallest eigenvectors
  - 3. Set *U* to be the *n* x *k* matrix with  $u_1, ..., u_k$  as columns. Take the *n* rows formed as points
  - 4. Run k-means on the representations

- Compare/contrast to **PCA**:
  - Use an eigendecomposition / dimensionality reduction
    - But, run on Laplacian (not covariance); use smallest eigenvectors, not largest
- Intuition: Laplacian encodes structure information
  - "Lower" eigenvectors give partitioning information

- **Q**: Why do this?
  - 1. No need for points or distances as input
  - 2. Can handle intuitive separation (k-means can't!)

# Unsupervised Learning Beyond Clustering

Data analysis, dimensionality reduction, etc

- Already talked about PCA
- Note: PCA can be used for visualization, but not specifically designed for it
- Some algorithms **specifically** for visualization

# **Dimensionality Reduction & Visualization**

Typical dataset: MNIST

- Handwritten digits 0-9
  - 60,000 images (small by ML standards)

  - Standard for image
- Dimensionality reduction?

# Visualization: T-SNE

Typical dataset: MNIST

- T-SNE: project data into just 2 dimensions
- Try to maintain structure

- MNIST Example
- **Input**: x<sub>1</sub>, x<sub>2</sub>, ..., x<sub>n</sub>
- **Output**: 2D/3D y<sub>1</sub>, y<sub>2</sub>, ..., y<sub>n</sub>

# **T-SNE** Algorithm: Step 1

How does it work? Two steps

- 1. Turn vectors into probability pairs
- 2. Turn pairs back into (lower-dim) vectors

Step 1:  

$$p_{j|i} = \frac{\exp(-\|x_i - x_j\|^2 / 2\sigma_i^2)}{\sum_{k \neq i} \exp(-\|x_i - x_k\|^2 / 2\sigma_i^2)} \quad p_{ij} = \frac{1}{2n} (p_{j|i} + p_{i|j})$$

 $X_4$ 

 $X_2$ 

**x**<sub>1</sub>

**Intuition**: probability that  $x_i$  would pick  $x_j$  as its neighbor under a Gaussian probability

# **T-SNE** Algorithm: Step 2

How does it work? Two steps

- 1. Turn vectors into probability pairs
- 2. Turn pairs back into (lower-dim) vectors

$$q_{ij} = \frac{(1 + \|y_i - y_j\|^2)^{-1}}{\sum_{k \neq \ell} (1 + \|y_k - y_\ell\|^2)^{-1}}$$

and minimize

Step 2: set

$$\sum_{i} \sum_{j} p_{j|i} \log \frac{p_{j|i}}{q_{j|i}} \quad \textbf{KL Divergence} \\ \text{between p and q}$$

X<sub>3</sub>

# **T-SNE** Algorithm: Step 2

More on step 2:

- We have two distributions *p*, *q*. *p* is fixed
- q is a function of the  $y_i$  which we move around
- Move y<sub>i</sub> around until the KL divergence is small
  - So we have a good representation!
- **Optimizing a loss function**---we'll see more in supervised learning.

KL Divergence between p and q

#### **T-SNE** Examples

- Examples: (from Laurens van der Maaten)
- Movies:

https://lvdmaaten.github.io/tsne/examples/netflix\_tsne.jpg

#### **T-SNE** Examples

- Examples: (from Laurens van der Maaten)
- NORB:

https://lvdmaaten.github.io/tsne/examples/norb\_tsne.jpg

# Visualization: T-SNE

#### t-SNE vs PCA?

- "Local" vs "Global"
- Lose information in t-SNE
   not a bad thing necessarily
- Downstream use

### Short Intro to Density Estimation

Goal: given samples  $x_1, ..., x_n$  from some distribution *P*, estimate P.

- Compute statistics (mean, variance)
- Generate samples from P
- Run inference

Zach Monge

#### Simplest Idea: Histograms

# Goal: given samples $x_1, ..., x_n$ from some distribution *P*, estimate P.

Define bins; count # of samples in each bin, normalize

# Simplest Idea: Histograms

Goal: given samples  $x_1, ..., x_n$  from some distribution *P*, estimate P.

#### **Downsides:**

- i) High-dimensions: most bins empty
- ii) Not continuous
- iii) How to choose bins?

#### **Kernel Density Estimation**

Goal: given samples  $x_1, ..., x_n$  from some distribution *P*, estimate P.

Idea: represent density as combination of "kernels"

#### **Kernel Density Estimation**

Idea: represent density as combination of kernels

• "Smooth" out the histogram
