1

Swapping Pages

- In this lecture:
 - When do pages get swapped
 - Where do they get put on disk?

2

When to swap

- The OS may write pages to disk and free memory two times
 - in the background, to make sure there are free pages in the future
 - on demand, when there is memory available
- Why have both?

3

Background swapping

- **Swap Daemon** (a kernel process) periodically wakes up and scans pages
 - Runs clock algorithm or adjusts working set sizes
 - Moves pages from “active” list – in use - to “inactive list” – candidate for eviction
- Clean and dirty pages treated differently
 - If a page is clean, it can be reused immediately
 - can put on free list
 - If a page is dirty, it must be written back first
 - swap daemon tries to write sets of pages at a time

4

Page fault to an inactive / free page

- What happens if a program references a page that is in the process of being written?
 - It can still use it without delay; page still contains data
- When should the OS clear the contents of a page?
 - When put on free list: don't have to clear it before returning it
 - When returned from allocator: can still use data on page fault to original virtual address

5

Where do pages go on disk?

- Kernel organizes regions of virtual memory as “areas” or segments according to how they are swapped
 - Data that gets swapped to the same file all goes to a segment
 - Multiple memory areas can get swapped to the same file in different places, or to anywhere in a “swap file” or “swap partition”
- How do you find a place to swap a page in the swap file?
 - Swap daemon maintains a “**swap map**” of
 - Which blocks on disk are in use
 - Which virtual pages are stored in those blocks

6

When is a page allocated space?

- When should a page be allocated/assigned space in swap?
 - When it is allocated?
 - ensures space available
 - Saves time on swapping
 - Total memory usage = swap
 - When it is evicted?
 - May never need to do it
 - Can put it in a better place, so write pages sequentially
 - total memory usage = swap + ram
