1

Testing for deadlock

- Steps
 - Collect “process state” and use it to build a graph
 - Ask each process “are you waiting for anything”?
 - Put an edge in the graph if so
 - We need to do this in a single instant of time, not while things might be changing
- Now need a way to test for cycles in our graph

2

Testing for deadlock

- One way to find cycles
 - Look for a node with no outgoing edges
 - Erase this node, and also erase any edges coming into it
 - Idea: This was a process people might have been waiting for, but it wasn't waiting for anything else
 - If (and only if) the graph has no cycles, we'll eventually be able to erase the whole graph!
- This is called a graph reduction algorithm

3

Resource allocation graph with no cycle

What would
cause a
deadlock?

6

Some questions you might ask

- If a system is deadlocked, could this go away?
 - No, unless someone kills one of the threads or something causes a process to release a resource
 - Many real systems put time limits on “waiting” precisely for this reason. When a process gets a timeout exception, it gives up waiting and this also can eliminate the deadlock
 - But that process may be forced to terminate itself because often, if a process can't get what it needs, there are no other options available!

7

Some questions you might ask

- Suppose a system isn't deadlocked at time T.
- Can we assume it will still be free of deadlock at time T+1?
 - No, because the very next thing it might do is to run some process that will request a resource...
 - ... establishing a cyclic wait
 - ... and causing deadlock

8

Problem 1: can it deadlock?

Process 0:

```
lock1.acquire();  
lock2.acquire();  
lock1.release();  
lock2.release();
```

Process 1:

```
lock1.acquire();  
lock2.acquire();  
lock1.release();  
lock2.release();
```

9

Problem 2: can it deadlock?

Process 0:

```
lock1.acquire();  
lock2.acquire();  
lock1.release();  
lock2.release();
```

Process 1:

```
lock2.acquire();  
lock1.acquire();  
lock1.release();  
lock2.release();
```

10

Problem 3: can it deadlock?

Process 0:

```
lock1.acquire();  
lock2.acquire();  
lock1.release();  
lock2.release();
```

Process 1:

```
lock2.acquire();  
lock2.release();  
lock1.acquire();  
lock1.release();
```

11

Dining Philosophers

- Problem Statement:
 - N Philosophers sitting at a round table
 - Each philosopher shares a fork with neighbor
 - Each philosopher must have both forks to eat
 - Neighbors can't eat simultaneously
 - Philosophers alternate between thinking and eating
- Each philosopher/thread *i* runs following code:

```
while (1) {  
    think();  
    take_forks(i);  
    eat();  
    put_forks(i);  
}
```

12

Dining Philosophers: Attempt #1

- Two neighbors can't use fork at same time
- Must test if fork is there and grab it atomically
 - Represent each fork with a semaphore
 - Grab right fork then left fork
- Code for 5 philosophers:

```
sem_t fork[5]; // Initialize each to 1
take_forks(int i) {
    wait(&fork[i]);
    wait(&fork[(i+1)%5]);
}
put_forks(int i) {
    signal(&fork[i]);
    signal(&fork[(i+1)%5]);
}
}
```
- What is wrong with this solution???

13

Dining Philosophers: Attempt #2

- Approach
 - Grab lower-numbered fork first, then higher-numbered
- Code for 5 philosophers:
- `sem_t fork[5];` // Initialize to 1

```
take_forks(int i) {
    if (i < 4) {
        wait(&fork[i]);
        wait(&fork[i+1]);
    } else {
        wait(&fork[0]);
        wait(&fork[4]);
    }
}
```
- What is wrong with this solution???

14

Dining Philosophers: How to Approach

- Guarantee two goals
 - Safety: Ensure nothing bad happens (don't violate constraints of problem)
 - Liveness: Ensure something good happens when it can (make as much progress as possible)
- Introduce state variable for each philosopher `i`
 - `state[i] = THINKING, HUNGRY, or EATING`
- Safety: No two adjacent philosophers eat simultaneously
 - for all `i`: `!(state[i]==EATING && state[i+1%5]==EATING)`
- Liveness: Not the case that a philosopher is hungry and his neighbors are not eating
 - for all `i`: `!(state[i]==HUNGRY && (state[i+4%5]!=EATING && state[i+1%5]!=EATING))`

15

Dining Philosophers: Solution

```
sem_t mayEat[5]; // how to initialize?
sem_t mutex; // how to init?
int state[5] = {THINKING};
take_forks(int i) {
    wait(&mutex); // enter critical section
    state[i] = HUNGRY;
    testSafetyAndLiveness(i); // check if I can run
    signal(&mutex); // exit critical section
    wait(&mayEat[i]);
}
put_forks(int i) {
    wait(&mutex); // enter critical section
    state[i] = THINKING;
    test(i+1 % 5); // check if neighbor can run now
    test(i+4 % 5);
    signal(&mutex); // exit critical section
}
testSafetyAndLiveness(int i) {
    if (state[i]==HUNGRY && state[i+4%5]!=EATING && state[i+1%5]!=EATING) {
        state[i] = EATING;
        signal(&mayEat[i]);
    }
}
```
