Note: Only non-terminals should be put into the table. Remember that a non-terminal appears in an entry i,j of the table if and only if the substring between index i and index j (inclusive) can be derived using that non-terminal. For example, the entry 3,5 corresponds to the substring "b + c", while the entry 1,2 corresponds to the substring "a =".

```
a = b + c - d;```
