

CS 540 Introduction to Artificial Intelligence Linear Models & Linear Regression
University of Wisconsin-Madison

Spring 2025

Announcements

- No in-person class this Wednesday due to travel. Will send recording.
- HW4 deadline on Monday Feb. 24th at 11:59 PM
- Class roadmap:

Outline

- Supervised Learning with Linear Models
 - Parameterized model, model classes, linear models, train vs. test
- Linear Regression
 - Least squares, normal equations, residuals, logistic regression

Supervised Learning

Supervised learning:

- Make predictions, classify data, perform regression
- Dataset: $(\mathbf{x}_1, y_1), (\mathbf{x}_2, y_2), \dots, (\mathbf{x}_n, y_n)$

• Goal: find function $f: X \to Y$ to predict label on **new** data

or

Regression

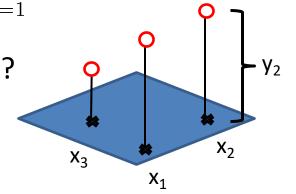

- Continuous label $y \in \mathbb{R}$
- Squared loss function $\ell(f(x), y) = (f(x) y)^2$
- Finding f that minimizes the empirical risk

$$\frac{1}{n} \sum_{i=1}^{n} \ell(f(x_i), y_i)$$

Functions/Models

The function f is usually called a model

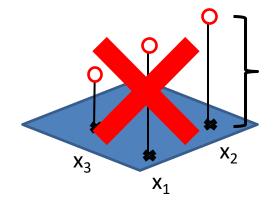

- Which possible functions should we consider?
- One option: all functions
 - Not a good choice. Consider $f(x) = \sum {1{x = x_i}y_i}$
 - Training loss: zero. Can't do better!
- How will it do on x not in the training set?
 (cannot generalize)

Functions/Models

Don't want all functions

- Instead, pick a specific class
- Parametrize it by weights/parameters
- Example: linear models

$$f(x) = \theta_0 + \theta_1 x_1 + \theta_2 x_2 + \dots + \theta_d x_d = \theta_0 + x^T \theta$$

Weights/ Parameters

Training The Model

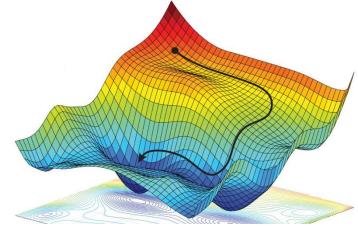

- Parametrize it by weights/parameters
- Minimize the loss

Best
$$\min_{\theta} \frac{1}{n} \sum_{i=1}^n \ell(f(x_i), y_i)$$
 parameters = Linear model best function f
$$= \frac{1}{n} \sum_{i=1}^n \ell(\theta_0 + x_i^T \theta, y_i)$$

$$= \frac{1}{n} \sum_{i=1}^n (\theta_0 + x_i^T \theta - y_i)^2$$

How Do We Minimize?

- Need to solve something that looks like $\min_{\theta} g(\theta)$
- Generic optimization problem; many algorithms
 - A popular choice: stochastic gradient descent (SGD)
 - Most algorithms iterative: find some sequence of points heading towards the optimum

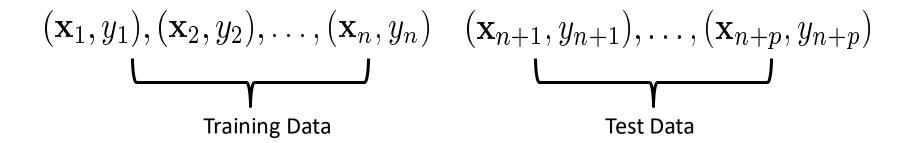

M. Hutson

Train vs Test

Now we've trained, have some f parametrized by θ

- Train loss is small $\rightarrow f$ predicts most x_i correctly
- How does f do on points not in training set? "Generalizes!"
- To evaluate this, reserve a test set. Do not train on it!

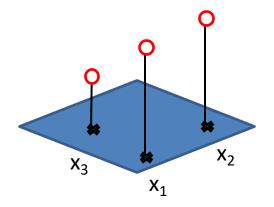

Train vs Test

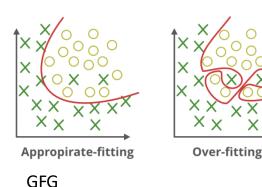

Use the test set to evaluate *f*

- Why? Back to our "perfect" train function
- Training loss: 0. Every point matched perfectly
- How does it do on test set? Fails completely!

- Overfitting: too focused on train points
- "Bigger" class: more prone to overfit
 - Need to consider model capacity

Q 1.1: When we train a model, we are

- A. Optimizing the parameters and keeping the features/inputs fixed.
- B. Optimizing the features and keeping the parameters fixed.
- C. Optimizing the parameters and the features.
- D. Keeping parameters and features fixed and changing the predictions.

Q 1.1: When we train a model, we are

- A. Optimizing the parameters and keeping the features fixed.
- B. Optimizing the features and keeping the parameters fixed.
- C. Optimizing the parameters and the features.
- D. Keeping parameters and features fixed and changing the predictions.

Q 1.1: When we train a model, we are

- A. Optimizing the parameters and keeping the features fixed.
- B. Optimizing the features and keeping the parameters fixed)
 (Feature vectors xi don't change during training).
- C. Optimizing the parameters and the features. (Same as B)
- D. Keeping parameters and features fixed and changing the predictions. (We can't train if we don't change the parameters)

• **Q 1.2**: You have trained a classifier, and you find there is significantly **higher** loss on the test set than the training set. What is likely the case?

- A. You have accidentally trained your classifier on the test set.
- B. Your classifier is generalizing well.
- C. Your classifier is generalizing poorly.
- D. Your classifier is ready for use.

• **Q 1.2**: You have trained a classifier, and you find there is significantly **higher** loss on the test set than the training set. What is likely the case?

- A. You have accidentally trained your classifier on the test set.
- B. Your classifier is generalizing well.
- C. Your classifier is generalizing poorly.
- D. Your classifier is ready for use.

• **Q 1.2**: You have trained a classifier, and you find there is significantly **higher** loss on the test set than the training set. What is likely the case?

- A. You have accidentally trained your classifier on the test set. (No, this would make test loss lower)
- B. Your classifier is generalizing well. (No, test loss is high means poor generalization)
- C. Your classifier is generalizing poorly.
- D. Your classifier is ready for use. (No, will perform poorly on new data)

 Q 1.3: You have trained a classifier, and you find there is significantly lower loss on the test set than the training set.
 What is likely the case?

- A. You have accidentally trained your classifier on the test set.
- B. Your classifier is generalizing well.
- C. Your classifier is generalizing poorly.
- D. Your classifier needs further training.

 Q 1.3: You have trained a classifier, and you find there is significantly lower loss on the test set than the training set.
 What is likely the case?

- A. You have accidentally trained your classifier on the test set. (This
 is very likely, loss will usually be the lowest on the data set on which a
 model has been trained)
- B. Your classifier is generalizing well.
- C. Your classifier is generalizing poorly.
- D. Your classifier needs further training.

Linear Regression

Simplest type of regression problem.

- Inputs: $(\mathbf{x}_1,y_1),(\mathbf{x}_2,y_2),\ldots,(\mathbf{x}_n,y_n)$
 - x's are vectors, y's are scalars.
 - "Linear": predict a linear combination of x components + intercept

$$f(x) = \theta_0 + \theta_1 x_1 + \theta_2 x_2 + \ldots + \theta_d x_d = \theta_0 + x^T \theta$$

• Want: parameters heta

Linear Regression Setup

Problem Setup

- Goal: figure out how to minimize square loss
- Let's organize it. Train set $(\mathbf{x}_1,y_1),(\mathbf{x}_2,y_2),\ldots,(\mathbf{x}_n,y_n)$
 - Since $f(x) = \theta_0 + x^T \theta$, use a notational trick by augmenting feature vector with a constant dimension of 1:

$$x = \begin{bmatrix} 1 \\ \chi \end{bmatrix}$$

– Then, with this one more dimension we can write (θ contains θ_0 now)

$$f(x) = x^T \theta$$

Linear Regression Setup

Problem Setup

- Train set $(\mathbf{x}_1, y_1), (\mathbf{x}_2, y_2), \dots, (\mathbf{x}_n, y_n)$
- Take train features and make it a $n^*(d+1)$ matrix, and y a vector:

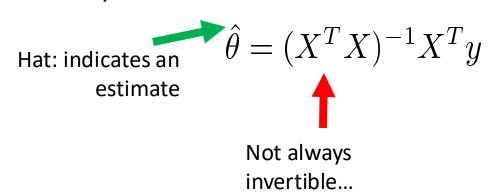

$$X = \begin{bmatrix} x_1^T \\ \dots \\ x_n^T \end{bmatrix} \qquad \qquad y = \begin{bmatrix} y_1 \\ \dots \\ y_n \end{bmatrix}$$

• Then, the empirical risk is $\frac{1}{n} ||X\theta - y||^2$

Finding The Estimated Parameters

Have our loss: $\frac{1}{n} ||X\theta - y||^2$

- Could optimize it with SGD, etc...
- But the minimum also has a closed-form solution (vector calculus):

"Normal Equations"

How Good are the Estimated Parameters?

Now we have parameters $\hat{\theta} = (X^T X)^{-1} X^T y$

- How good are they?
- Predictions are $f(x_i) = \hat{\theta}^T x_i = ((X^T X)^{-1} X^T y)^T x_i$
- Errors ("residuals")

$$|y_i - f(x_i)| = |y_i - \hat{\theta}^T x_i| = |y_i - ((X^T X)^{-1} X^T y)^T x_i|$$

- If data is linear, residuals are 0. Almost never the case!
- Mean squared error on a test set $\frac{1}{m} \sum_{i=n+1}^{n+m} (\hat{\theta}^T x_i y_i)^2$

Linear Regression → Classification?

What if we want the same idea, but y is 0 or 1?

• Need to convert the $\, heta^T x\,$ to a probability in [0,1]

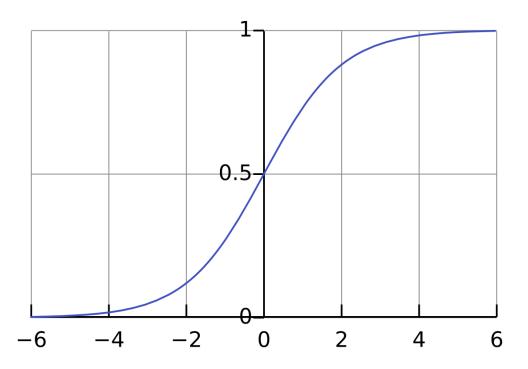

$$p(y=1|x) = \frac{1}{1 + \exp(-\theta^T x)} \quad \longleftarrow \text{ Logistic function}$$

Why does this work?

- If $\theta^T x$ is really big, $\exp(-\theta^T x)$ is really small $\rightarrow p$ close to 1
- If really negative exp is huge $\rightarrow p$ close to 0

"Logistic Regression"

Logistic function

Q 2.1: You have a dataset for regression given by $(x_1, y_1) = ([-1,0,1], 2)$ and $(x_2, y_2) = ([2,3,1], 4)$.

What are the labels, number of points (n), and dimension of the features (d)?

- A. labels are 2 and 4; n=3, and d=2.
- B. labels are 2 and 4; n=2, and d=3.
- C. labels are [-1,0,1] and [2,3,1]; n=2, and d=4.
- D. labels are 2 and 3; n=4, and d=2.

Q 2.1: You have a dataset for regression given by $(x_1, y_1) = ([-1,0,1], 2)$ and $(x_2, y_2) = ([2,3,1], 4)$.

What are the labels, number of points (n), and dimension of the features (d)?

- A. labels are 2 and 4; n=3, and d=2.
- B. labels are 2 and 4; n=2, and d=3.
- C. labels are [-1,0,1] and [2,3,1]; n=2, and d=4.
- D. labels are 2 and 3; n=4, and d=2.

Q 2.1: You have a dataset for regression given by $(x_1, y_1) = ([-1,0,1], 2)$ and $(x_2, y_2) = ([2,3,1], 4)$.

What are the labels, number of points (n), and dimension of the features (d)?

- A. labels are 2 and 4; n=3, and d=2.
- B. labels are 2 and 4; n=2, and d=3.
- C. labels are [-1,0,1] and [2,3,1]; n=2, and d=4.
- D. labels are 2 and 3; n=4, and d=2.

There are two data points, each x has 3 features, and the labels are the y-values.

Q 2.2: You have a dataset for regression given by $(x_1, y_1) = ([-1,0,1], 2)$ and $(x_2, y_2) = ([2,3,1], 4)$.

We have the weights $\beta_0=0, \beta_1=2, \beta_2=1, \beta_3=1$. Predict $\widehat{\boldsymbol{y}}$ for x=[1,10,1]

- A. 15
- B. 9
- C. 13
- D. 21

Q 2.2: You have a dataset for regression given by $(x_1, y_1) = ([-1,0,1], 2)$ and $(x_2, y_2) = ([2,3,1], 4)$.

We have the weights $\beta_0=0, \beta_1=2, \beta_2=1, \beta_3=1$. Predict $\widehat{\boldsymbol{y}}$ for x=[1,10,1]

- A. 15
- B. 9
- C. 13
- D. 21

Q 2.2: You have a dataset for regression given by $(x_1, y_1) = ([-1,0,1], 2)$ and $(x_2, y_2) = ([2,3,1], 4)$.

We have the weights $\beta_0=0$, $\beta_1=2$, $\beta_2=1$, $\beta_3=1$. Predict $\widehat{\boldsymbol{y}}$ for x=[1,10,1]

- A. 15
- B. 9
- C. 13
- D. 21

$$\hat{y} = 1 * \beta_0 + 1 * \beta_1 + 10 * \beta_2 + 1 * \beta_3 = 13$$

Q 2.3: You have a dataset for regression given by $(x_1, y_1) = ([-1,0,1], 2)$ and $(x_2, y_2) = ([2,3,1], 4)$.

We have the weights $\beta_0 = 0$, $\beta_1 = 2$, $\beta_2 = 1$, $\beta_3 = 1$. What is the mean squared error (MSE) on the training set?

- A. 9
- B. 13/2
- C. 25/2
- D. 25

Q 2.3: You have a dataset for regression given by $(x_1, y_1) = ([-1,0,1], 2)$ and $(x_2, y_2) = ([2,3,1], 4)$.

We have the weights $\beta_0 = 0$, $\beta_1 = 2$, $\beta_2 = 1$, $\beta_3 = 1$. What is the mean squared error (MSE) on the training set?

- A. 9
- B. 13/2
- C. **25/2**
- D. 25

Q 2.3: You have a dataset for regression given by $(x_1, y_1) = ([-1,0,1], 2)$ and $(x_2, y_2) = ([2,3,1], 4)$.

We have the weights $\beta_0 = 0$, $\beta_1 = 2$, $\beta_2 = 1$, $\beta_3 = 1$. What is the mean squared error (MSE) on the training set?

- A. 9
- B. 13/2
- C. 25/2
- D. 25

Compute the predicted label for each data point, then compute the squared error for each data point, then take the mean error of the two points:

$$\hat{y}_1 = -1 * \beta_1 + 0 * \beta_2 + 1 * \beta_3 = -1$$
$$\ell(\hat{y}_1, y_1) = (-1 - 2)^2 = 9$$

$$\hat{y}_2 = 2 * \beta_1 + 3 * \beta_2 + 1 * \beta_3 = 8$$

$$\ell(\hat{y}_1, y_1) = (8 - 4)^2 = 16$$

$$MSE = (16 + 9) / 2 = 25 / 2$$
