

### CS 540 Introduction to Artificial Intelligence Linear Models & Linear Regression University of Wisconsin-Madison

Spring 2025

#### Announcements

- Homeworks:
  - HW4 deadline on Monday Feb. 24<sup>th</sup> at 11:59 PM
- Class roadmap:

ML Linear Regression

Machine Learning: K -Nearest Neighbors & Naive Bayes

Machine Learning: Neural Networks I (Perceptron)

Machine Learning: Neural Networks II Supervised Learning

# Outline

- Supervised Learning with Linear Models
  - Parameterized model, model classes, linear models, train vs. test
- Linear Regression
  - Least squares, normal equations, residuals, logistic regression

#### Supervised Learning

#### Supervised learning:

- Make predictions, classify data, perform regression
- Dataset:  $(\mathbf{x}_1, y_1), (\mathbf{x}_2, y_2), \dots, (\mathbf{x}_n, y_n)$

Feature vector / Covariates / Input

Label

• Goal: find function  $f: X \to Y$  to predict label on **new** data

indoor

outdoor

#### Regression

- Continuous label  $y \in \mathbb{R}$
- Squared loss function  $\ell(f(x), y) = (f(x) y)^2$
- Finding *f* that minimizes the empirical risk

$$\frac{1}{n}\sum_{i=1}^{n}\ell(f(x_i), y_i)$$

#### Functions/Models

i=1

X<sub>2</sub>

 $X_{2}$ 

The function *f* is usually called a model

- Which possible functions should we consider?
- One option: all functions
  - Not a good choice. Consider  $f(x) = \sum {}_{i} \{x = x_i\} y_i$
  - Training loss: zero. Can't do better!
  - How will it do on x not in the training set?

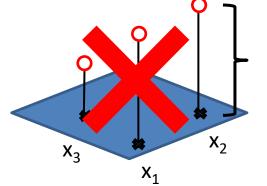

(cannot generalize)

#### Functions/Models

#### Don't want all functions

- Instead, pick a specific class
- Parametrize it by weights/parameters
- Example: linear models

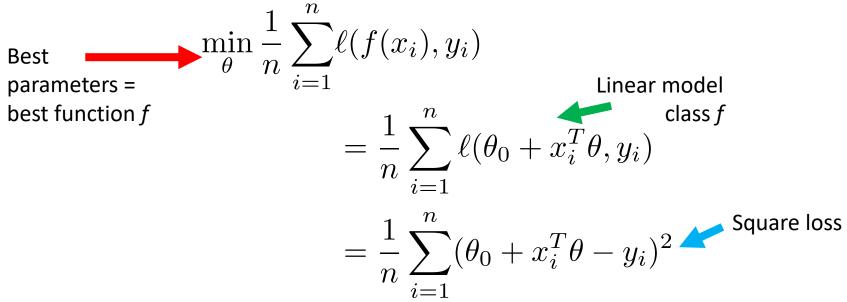

$$f(x) = \theta_0 + \theta_1 x_1 + \theta_2 x_2 + \dots + \theta_d x_d = \theta_0 + x^T \theta$$

Weights/ Parameters

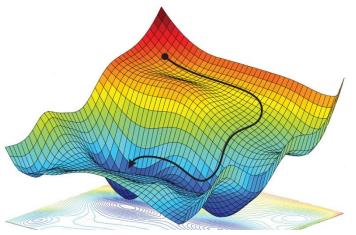

#### **Training The Model**

- Parametrize it by weights/parameters
- Minimize the loss

#### How Do We Minimize?

- Need to solve something that looks like  $\min_{\theta} g(\theta)$
- Generic optimization problem; many algorithms
  - A popular choice: stochastic gradient descent (SGD)
    - Most algorithms iterative: find some sequence of points heading towards the optimum

M. Hutson

#### Train vs Test

Now we've trained, have some f parametrized by  $\theta$ 

- Train loss is small  $\rightarrow f$  predicts most  $x_i$  correctly
- How does f do on points not in training set? "Generalizes!"
- To evaluate this, reserve a **test** set. Do **not** train on it!

$$(\mathbf{x}_1, y_1), (\mathbf{x}_2, y_2), \dots, (\mathbf{x}_n, y_n) \quad (\mathbf{x}_{n+1}, y_{n+1}), \dots, (\mathbf{x}_{n+p}, y_{n+p})$$

$$(\mathbf{x}_1, y_1), (\mathbf{x}_2, y_2), \dots, (\mathbf{x}_n, y_n) \quad (\mathbf{x}_{n+1}, y_{n+1}), \dots, (\mathbf{x}_{n+p}, y_{n+p})$$

$$(\mathbf{x}_1, y_1), (\mathbf{x}_2, y_2), \dots, (\mathbf{x}_n, y_n) \quad (\mathbf{x}_{n+1}, y_{n+1}), \dots, (\mathbf{x}_{n+p}, y_{n+p})$$

$$(\mathbf{x}_1, y_1), (\mathbf{x}_2, y_2), \dots, (\mathbf{x}_n, y_n) \quad (\mathbf{x}_{n+1}, y_{n+1}), \dots, (\mathbf{x}_{n+p}, y_{n+p})$$

$$(\mathbf{x}_1, y_1), (\mathbf{x}_2, y_2), \dots, (\mathbf{x}_n, y_n) \quad (\mathbf{x}_{n+1}, y_{n+1}), \dots, (\mathbf{x}_{n+p}, y_{n+p})$$

$$(\mathbf{x}_1, y_1), (\mathbf{x}_2, y_2), \dots, (\mathbf{x}_n, y_n) \quad (\mathbf{x}_{n+1}, y_{n+1}), \dots, (\mathbf{x}_{n+p}, y_{n+p})$$

$$(\mathbf{x}_1, y_1), (\mathbf{x}_2, y_2), \dots, (\mathbf{x}_n, y_n) \quad (\mathbf{x}_{n+1}, y_{n+1}), \dots, (\mathbf{x}_{n+p}, y_{n+p})$$

$$(\mathbf{x}_1, y_1), (\mathbf{x}_2, y_2), \dots, (\mathbf{x}_n, y_n) \quad (\mathbf{x}_{n+1}, y_{n+1}), \dots, (\mathbf{x}_{n+p}, y_{n+p})$$

$$(\mathbf{x}_1, y_1), (\mathbf{x}_2, y_2), \dots, (\mathbf{x}_n, y_n) \quad (\mathbf{x}_{n+1}, y_{n+1}), \dots, (\mathbf{x}_{n+p}, y_{n+p})$$

$$(\mathbf{x}_1, y_2), \dots, (\mathbf{x}_n, y_n) \quad (\mathbf{x}_1, y_1), \dots, (\mathbf{x}_{n+p}, y_{n+p})$$

$$(\mathbf{x}_1, y_2), \dots, (\mathbf{x}_n, y_n) \quad (\mathbf{x}_1, y_2), \dots, (\mathbf{x}_n, y_n)$$

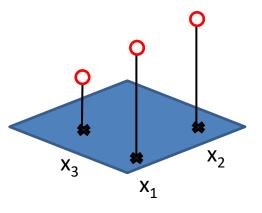

$$(\mathbf{x}_1, y_2), \dots, (\mathbf{x}_n, y_n) \quad (\mathbf{x}_1, y_2), \dots, (\mathbf{x}_n, y_n)$$

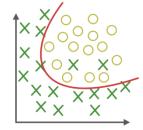

$$(\mathbf{x}_1, y_2), \dots, (\mathbf{x}_n, y_n)$$

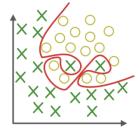

#### Train vs Test

Use the test set to evaluate *f* 

- Why? Back to our "perfect" train function
- Training loss: 0. Every point matched perfectly
- How does it do on test set? Fails completely!
- Test set helps detect overfitting
  - Overfitting: too focused on train points
  - "Bigger" class: more prone to overfit
    - Need to consider model capacity

Appropirate-fitting

GFG

**Over-fitting** 

**Q 1.1**: When we train a model, we are

- A. Optimizing the parameters and keeping the features fixed.
- B. Optimizing the features and keeping the parameters fixed.
- C. Optimizing the parameters and the features.
- D. Keeping parameters and features fixed and changing the predictions.

**Q 1.1**: When we train a model, we are

- A. Optimizing the parameters and keeping the features fixed.
- B. Optimizing the features and keeping the parameters fixed.
- C. Optimizing the parameters and the features.
- D. Keeping parameters and features fixed and changing the predictions.

**Q 1.1**: When we train a model, we are

- A. Optimizing the parameters and keeping the features fixed.
- B. Optimizing the features and keeping the parameters fixed) (Feature vectors xi don't change during training).
- C. Optimizing the parameters and the features. (Same as B)
- D. Keeping parameters and features fixed and changing the predictions. (We can't train if we don't change the parameters)

 Q 1.2: You have trained a classifier, and you find there is significantly higher loss on the test set than the training set. What is likely the case?

- A. You have accidentally trained your classifier on the test set.
- B. Your classifier is generalizing well.
- C. Your classifier is generalizing poorly.
- D. Your classifier is ready for use.

 Q 1.2: You have trained a classifier, and you find there is significantly higher loss on the test set than the training set. What is likely the case?

- A. You have accidentally trained your classifier on the test set.
- B. Your classifier is generalizing well.
- C. Your classifier is generalizing poorly.
- D. Your classifier is ready for use.

- Q 1.2: You have trained a classifier, and you find there is significantly higher loss on the test set than the training set. What is likely the case?
- A. You have accidentally trained your classifier on the test set. (No, this would make test loss lower)
- B. Your classifier is generalizing well. (No, test loss is high means poor generalization)
- C. Your classifier is generalizing poorly.
- D. Your classifier is ready for use. (No, will perform poorly on new data)

 Q 1.3: You have trained a classifier, and you find there is significantly lower loss on the test set than the training set. What is likely the case?

- A. You have accidentally trained your classifier on the test set.
- B. Your classifier is generalizing well.
- C. Your classifier is generalizing poorly.
- D. Your classifier needs further training.

 Q 1.3: You have trained a classifier, and you find there is significantly lower loss on the test set than the training set. What is likely the case?

- A. You have accidentally trained your classifier on the test set. (This is very likely, loss will usually be the lowest on the data set on which a model has been trained)
- B. Your classifier is generalizing well.
- C. Your classifier is generalizing poorly.
- D. Your classifier needs further training.

#### **Linear Regression**

Simplest type of regression problem.

• Inputs:  $(\mathbf{x}_1, y_1), (\mathbf{x}_2, y_2), \dots, (\mathbf{x}_n, y_n)$ 

x's are vectors, y's are scalars.

"Linear": predict a linear combination
 of x components + intercept

$$f(x) = \theta_0 + \theta_1 x_1 + \theta_2 x_2 + \ldots + \theta_d x_d = \theta_0 + x^T \theta_0$$

• Want: parameters heta

#### Linear Regression Setup

#### **Problem Setup**

• Goal: figure out how to minimize square loss

[1]

- Let's organize it. Train set  $(\mathbf{x}_1, y_1), (\mathbf{x}_2, y_2), \dots, (\mathbf{x}_n, y_n)$ 
  - Since  $f(x) = \theta_0 + x^T \theta$ , use a notational trick by augmenting feature vector with a constant dimension of 1:

$$x = \lfloor x \rfloor$$
  
- Then, with this one more dimension we can write ( $\theta$   
contains  $\theta_0$  now)  
 $f(x) = x^T \theta$ 

#### Linear Regression Setup

#### **Problem Setup**

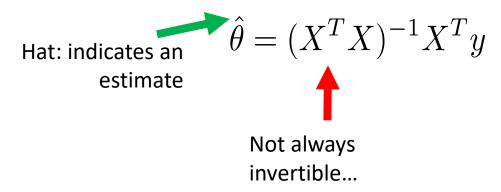

- Train set  $(\mathbf{x}_1, y_1), (\mathbf{x}_2, y_2), \dots, (\mathbf{x}_n, y_n)$
- Take train features and make it a n\*(d+1) matrix, and y a vector:

• Then, the empirical risk is  $\frac{1}{n} ||X\theta - y||^2$ 

#### Finding The Estimated Parameters

Have our loss:  $\frac{1}{n} ||X\theta - y||^2$ 

- Could optimize it with SGD, etc...
- But the minimum also has a closed-form solution (vector calculus):

"Normal Equations"

#### How Good are the Estimated Parameters?

Now we have parameters  $\hat{\theta} = (X^T X)^{-1} X^T y$ 

- How good are they?
- Predictions are  $f(x_i) = \hat{\theta}^T x_i = ((X^T X)^{-1} X^T y)^T x_i$
- Errors ("residuals")

$$|y_i - f(x_i)| = |y_i - \hat{\theta}^T x_i| = |y_i - ((X^T X)^{-1} X^T y)^T x_i|$$

- If data is linear, residuals are 0. Almost never the case!
- Mean squared error on a test set \_ <u>n+m</u>

$$\frac{1}{m}\sum_{i=n+1}^{n+m} \left(\hat{\theta}^T x_i - y_i\right)^2$$

#### Linear Regression $\rightarrow$ Classification?

What if we want the same idea, but y is 0 or 1?

• Need to convert the  $\theta^T x$  to a probability in [0,1]

$$p(y = 1|x) = \frac{1}{1 + \exp(-\theta^T x)} \quad \leftarrow \text{ Logistic function}$$

Why does this work?

- If  $\theta^T x$  is really big,  $\exp(-\theta^T x)$  is really small  $\rightarrow p$  close to 1
- If really negative exp is huge  $\rightarrow p$  close to 0

#### "Logistic Regression"

**Q 2.1**: You have a dataset for regression given by  $(x_1, y_1) = ([-1,0,1], 2)$  and  $(x_2, y_2) = ([2,3,1], 4)$ .

What are the labels, number of points (n), and dimension of the features (d)?

- A. labels are 2 and 4; n=3, and d=2.
- B. labels are 2 and 4; n=2, and d=3.
- C. labels are [-1,0,1] and [2,3,1]; n=2, and d=4.
- D. labels are 2 and 3; n=4, and d=2.

**Q 2.1**: You have a dataset for regression given by  $(x_1, y_1) = ([-1,0,1], 2)$  and  $(x_2, y_2) = ([2,3,1], 4)$ .

What are the labels, number of points (n), and dimension of the features (d)?

- A. labels are 2 and 4; n=3, and d=2.
- B. labels are 2 and 4; n=2, and d=3.
- C. labels are [-1,0,1] and [2,3,1]; n=2, and d=4.
- D. labels are 2 and 3; n=4, and d=2.

**Q 2.1**: You have a dataset for regression given by  $(x_1, y_1) = ([-1,0,1], 2)$  and  $(x_2, y_2) = ([2,3,1], 4)$ .

What are the labels, number of points (n), and dimension of the features (d)?

- A. labels are 2 and 4; n=3, and d=2.
- B. labels are 2 and 4; n=2, and d=3.

There are two data points, each x has 3 features, and the labels are the y-values.

- C. labels are [-1,0,1] and [2,3,1]; n=2, and d=4.
- D. labels are 2 and 3; n=4, and d=2.

**Q 2.2**: You have a dataset for regression given by  $(x_1, y_1) = ([-1,0,1], 2)$  and  $(x_2, y_2) = ([2,3,1], 4)$ . We have the weights  $\beta_0 = 0$ ,  $\beta_1 = 2$ ,  $\beta_2 = 1$ ,  $\beta_3 = 1$ . Predict  $\hat{y}$  for x = [1, 10, 1]

- A. 15
- B. 9
- C. 13
- D. 21

**Q 2.2**: You have a dataset for regression given by  $(x_1, y_1) = ([-1,0,1], 2)$  and  $(x_2, y_2) = ([2,3,1], 4)$ . We have the weights  $\beta_0 = 0$ ,  $\beta_1 = 2$ ,  $\beta_2 = 1$ ,  $\beta_3 = 1$ . Predict  $\hat{y}$  for x = [1, 10, 1]

- A. 15
- B. 9
- C. 13
- D. 21

**Q 2.2**: You have a dataset for regression given by  $(x_1, y_1) = ([-1,0,1], 2)$  and  $(x_2, y_2) = ([2,3,1], 4)$ . We have the weights  $\beta_0 = 0$ ,  $\beta_1 = 2$ ,  $\beta_2 = 1$ ,  $\beta_3 = 1$ . Predict  $\hat{y}$  for x = [1, 10, 1]

• A. 15

$$\hat{y} = 1 * \beta_0 + 1 * \beta_1 + 10 * \beta_2 + 1 * \beta_3 = 13$$

- B. 9
- C. 13
- D. 21

**Q 2.3**: You have a dataset for regression given by  $(x_1, y_1) = ([-1,0,1], 2)$  and  $(x_2, y_2) = ([2,3,1], 4)$ . We have the weights  $\beta_0 = 0$ ,  $\beta_1 = 2$ ,  $\beta_2 = 1$ ,  $\beta_3 = 1$ . What is the mean squared error (MSE) on the training set?

- A. 9
- B. 13/2
- C. 25/2
- D. 25

**Q 2.3**: You have a dataset for regression given by  $(x_1, y_1) = ([-1,0,1], 2)$  and  $(x_2, y_2) = ([2,3,1], 4)$ . We have the weights  $\beta_0 = 0$ ,  $\beta_1 = 2$ ,  $\beta_2 = 1$ ,  $\beta_3 = 1$ . What is the mean squared error (MSE) on the training set?

- A. 9
- B. 13/2
- C. **25/2**
- D. 25

**Q 2.3**: You have a dataset for regression given by  $(x_1, y_1) = ([-1,0,1], 2)$  and  $(x_2, y_2) = ([2,3,1], 4)$ . We have the weights  $\beta_0 = 0$ ,  $\beta_1 = 2$ ,  $\beta_2 = 1$ ,  $\beta_3 = 1$ . What is the mean squared error (MSE) on the training set?

- A. 9
- B. 13/2
- C. **25/2**
- D. 25

*Compute the predicted label for each data point, then compute the squared error for each data point, then take the mean error of the two points:* 

$$\hat{y}_1 = -1 * \beta_1 + 0 * \beta_2 + 1 * \beta_3 = -1$$
  
$$\ell(\hat{y}_1, y_1) = (-1 - 2)^2 = 9$$

$$\begin{aligned} \hat{y}_2 &= 2 \; * \beta_1 + 3 * \beta_2 + 1 * \beta_3 = 8 \\ \ell(\hat{y}_1, y_1) &= (8 - 4)^2 = 16 \\ \text{MSE} &= (16 + 9) \, / \, 2 = 25 \, / \, 2 \end{aligned}$$
