Neural Networks: Review

University of Wisconsin-Madison
Spring 2025

Announcements

- **Homework:**

- HW7 is due on **Monday Apr. 7th at 11:59 PM**

- **Class roadmap:**

Deep Learning and Neural Network's Summary
Search I: Un-Informed search
Search II: Informed search

How to classify

Cats vs. dogs?

Neural networks can also be used for regression.

- Typically, no activation on outputs, mean squared error loss function.

Single-layer
Perceptron

Multi-layer
Perceptron

Training of neural
networks

Convolutional
neural networks

Inspiration from neuroscience

- Inspirations from human brains
- Networks of **simple** and **homogenous** units (a.k.a **neuron**)

(wikipedia)

Perceptron

- Given input $\mathbf{x}$, weight $\mathbf{w}$ and bias b , perceptron outputs:

$$o = \sigma(\mathbf{w}^T \mathbf{x} + b)$$

$$\sigma(x) = \begin{cases} 1 & \text{if } x > 0 \\ 0 & \text{otherwise} \end{cases}$$

Activation function

Cats vs. dogs?

Perceptron

- Goal: learn parameters $\mathbf{w} = \{w_1, w_2, \dots, w_d\}$ and b to minimize the classification error

Cats vs. dogs?

Learning logic functions using perceptron

The perceptron can learn an AND function

$$x_1 = 1, x_2 = 1, y = 1$$

$$x_1 = 1, x_2 = 0, y = 0$$

$$x_1 = 0, x_2 = 1, y = 0$$

$$x_1 = 0, x_2 = 0, y = 0$$

Learning logic functions using perceptron

The perceptron can learn an AND function

Learning OR function using perceptron

The perceptron can learn an OR function

XOR Problem (Minsky & Papert, 1969)

The perceptron cannot learn an XOR function
(neurons can only generate linear separators)

$$x_1 = 1, x_2 = 1, y = 0$$

$$x_1 = 1, x_2 = 0, y = 1$$

$$x_1 = 0, x_2 = 1, y = 1$$

$$x_1 = 0, x_2 = 0, y = 0$$

This contributed to the first AI winter

Quiz break

Which one of the following is NOT true about perceptron?

- A. Perceptron only works if the data is linearly separable.
- B. Perceptron can learn AND function
- C. Perceptron can learn XOR function
- D. Perceptron is a supervised learning algorithm

Quiz break

Which one of the following is NOT true about perceptron?

- A. Perceptron only works if the data is linearly separable.
- B. Perceptron can learn AND function
- C. Perceptron can learn XOR function
- D. Perceptron is a supervised learning algorithm

Multilayer Perceptron

Single Hidden Layer

How to classify

Cats vs. dogs?

Single Hidden Layer

- Input $\mathbf{x} \in \mathbb{R}^d$
- Hidden $\mathbf{W} \in \mathbb{R}^{m \times d}, \mathbf{b} \in \mathbb{R}^m$
- Intermediate output

$$\mathbf{h} = \sigma(\mathbf{W}\mathbf{x} + \mathbf{b})$$

σ is an element-wise
activation function

Neural networks with one hidden layer

Neural networks with one hidden layer

Key elements: linear operations + Nonlinear activations

Single Hidden Layer

- Output $f = \mathbf{w}_2^\top \mathbf{h} + b_2$
- Normalize the output into probability using sigmoid

$$p(y = 1 \mid \mathbf{x}) = \frac{1}{1 + e^{-f}}$$

Sigmoid

Multi-class classification

Turns outputs f into k probabilities (sum up to 1 across k classes)

$$\begin{aligned} p(y|\mathbf{x}) &= \textit{softmax}(\mathbf{f}) \\ &= \frac{\exp f_y(x)}{\sum_i^k \exp f_i(x)} \end{aligned}$$

Deep neural networks (DNNs)

$$\mathbf{h}_1 = \sigma(\mathbf{W}_1 \mathbf{x} + \mathbf{b}_1)$$

$$\mathbf{h}_2 = \sigma(\mathbf{W}_2 \mathbf{h}_1 + \mathbf{b}_2)$$

$$\mathbf{h}_3 = \sigma(\mathbf{W}_3 \mathbf{h}_2 + \mathbf{b}_3)$$

$$\mathbf{f} = \mathbf{W}_4 \mathbf{h}_3 + \mathbf{b}_4$$

$$\mathbf{y} = \text{softmax}(\mathbf{f})$$

NNs are composition
of nonlinear
functions

Classify MNIST handwritten digits

How to train a neural network?

Loss function: $\frac{1}{|D|} \sum_i \ell(\mathbf{x}_i, y_i)$

Per-sample loss:

$$\ell(\mathbf{x}, y) = \sum_{j=1}^K -y_j \log p_j$$

Also known as **cross-entropy loss**
or **softmax loss**

Cross-Entropy Loss

softmax
(model prediction)

True label

0.8

0.2

1

$$L_{CE} = \sum_j -y_j \log(p_j)$$

$$= -\log(0.8)$$

p

Y

Goal: push p and Y to be identical

Neural Networks

How to train a neural network?

Update the weights W to minimize the loss function

$$L = \frac{1}{|D|} \sum_i \ell(\mathbf{x}_i, y_i)$$

Use gradient descent!

Gradient Descent

- Choose a learning rate $\alpha > 0$
- Initialize the model parameters w_0
- For $t = 1, 2, \dots$
 - Update parameters:

$$\begin{aligned}\mathbf{w}_t &= \mathbf{w}_{t-1} - \alpha \frac{\partial L}{\partial \mathbf{w}_{t-1}} \\ &= \mathbf{w}_{t-1} - \alpha \frac{1}{|D|} \sum_{\mathbf{x} \in D} \frac{\partial \ell(\mathbf{x}_i, y_i)}{\partial \mathbf{w}_{t-1}}\end{aligned}$$

D can be very large. Expensive per iteration

- Repeat until converges

Minibatch Stochastic Gradient Descent

- Choose a learning rate $\alpha > 0$
 - Initialize the model parameters w_0
 - For $t = 1, 2, \dots$
 - Randomly sample a subset (mini-batch) $B \subset D$
- Update parameters:

$$\mathbf{w}_t = \mathbf{w}_{t-1} - \alpha \frac{1}{|B|} \sum_{\mathbf{x} \in B} \frac{\partial \ell(\mathbf{x}_i, y_i)}{\partial \mathbf{w}_{t-1}}$$

- Repeat

Calculate gradient: backpropagation with chain rule

- Define a loss function L , must compute $\frac{\partial L}{\partial \mathbf{W}}$, $\frac{\partial L}{\partial \mathbf{b}}$ for all weights and biases.
- Gradient to a variable =
gradient on the top x gradient from the current operation

Non-convex Optimization

[Gao and Li et al., 2018]

How to classify

Cats vs. dogs?

Dual
12MP
wide-angle and
telephoto cameras

36M floats in a RGB image!

Fully Connected Networks

Cats vs. dogs?

$\sim 36\text{M elements} \times 100 = \sim \mathbf{3.6B}$ parameters!

Convolutions come to rescue!

Where is
Waldo?

Why Convolution?

- Translation Invariance
- Locality

- **X**: $n_h \times n_w$ input matrix
- **W**: $k_h \times k_w$ kernel matrix
- **b**: scalar bias
- **Y**: $(n_h - k_h + 1) \times (n_w - k_w + 1)$ output matrix

$$\mathbf{Y} = \mathbf{X} \star \mathbf{W} + b$$

- **W** and **b** are learnable parameters

2-D Convolution Layer with Stride and Padding

- Stride is the #rows/#columns per slide
- Padding adds rows/columns around input
- Output shape

Kernel/filter size

$$\lfloor (n_h - k_h + p_h + s_h) / s_h \rfloor \times \lfloor (n_w - k_w + p_w + s_w) / s_w \rfloor$$

Input size

Pad

Stride

Multiple Input Channels

- Input and kernel can be 3D, e.g., an RGB image have 3 channels
- Have a kernel for each channel, and then sum results over channels

Multiple Input Channels

- Input and kernel can be 3D, e.g., an RGB image have 3 channels
- Have a 2D kernel for each channel, and then sum results over channels

Multiple Input Channels

- Input and kernel can be 3D, e.g., an RGB image have 3 channels
- Also call each 3D kernel a “**filter**”, which produce only **one** output channel (due to summation over channels)

RGB (3 input channels)

Multiple filters (in one layer)

- Apply multiple filters on the input
- Each filter may learn different features about the input
- Each filter (3D kernel) produces one output channel

Conv1 Filters in AlexNet

- 96 filters (each of size 11x11x3)
- Gabor filters

Figures from Visualizing and Understanding Convolutional Networks
by *M. Zeiler and R. Fergus*

Multiple Output Channels

- The # of output channels = # of filters

- Input $\mathbf{X}: c_i \times n_h \times n_w$

- Kernel $\mathbf{W}: c_o \times c_i \times k_h \times k_w$

- Output $\mathbf{Y}: c_o \times m_h \times m_w$

$$\mathbf{Y}_{i,:,:} = \mathbf{X} \star \mathbf{W}_{i,:,:,:}$$

for $i = 1, \dots, c_o$

Quiz break

Which one of the following is NOT true?

- A. LeNet has two convolutional layers
- B. The first convolutional layer in LeNet has $5 \times 5 \times 6 \times 3$ parameters, in case of RGB input
- C. Pooling is performed right after convolution
- D. Pooling layer does not have learnable parameters

Quiz break

Which one of the following is NOT true?

- A. LeNet has two convolutional layers
- B. The first convolutional layer in LeNet has $5 \times 5 \times 6 \times 3$ parameters, in case of RGB input
- C. Pooling is performed right after convolution
- D. Pooling layer does not have learnable parameters

Pooling is performed after ReLU: conv -> relu -> pooling

Evolution of neural net architectures

AlexNet

[Krizhevsky et al. 2012]

AlexNet vs LeNet Architecture

Larger pool size, change to max pooling

Larger kernel size, stride because of the increased image size, and more output channels.

AlexNet

LeNet

AlexNet Architecture

AlexNet

3 additional convolutional layers

More output channels.

LeNet

ResNet: Going deeper in depth

ImageNet Top-5 error%

[He et al. 2015]

Other neural network architectures

- Convolutional neural networks are one of many special types of layers.
 - Main use is for processing images.
 - Also can be useful for handling time series.
- Other common architectures:
 - Recurrent neural networks: hidden activations are a function of input and activations from previous inputs. Designed for sequential data such as text.
 - Graph neural networks: take graph data as input.
 - Transformers: take sequences as input and learn what parts of input to pay attention to.

Brief history of neural networks

What we've learned today...

- Modeling a single neuron
 - Linear perceptron
 - Limited power of a single neuron
- Multi-layer perceptron
- Training of neural networks
 - Loss function (cross entropy)
 - Backpropagation and SGD
- Convolutional neural networks
 - Convolution, pooling, stride, padding
 - Basic architectures (LeNet etc.)
 - More advanced architectures (AlexNet, ResNet etc)

Thank you!

Some of the slides in these lectures have been adapted from materials developed by Alex Smola and Mu Li:
