OUTLINE

Conceptual model

Hands-on activity

My own research on human-robot interaction

CONCEPTUAL MODEL

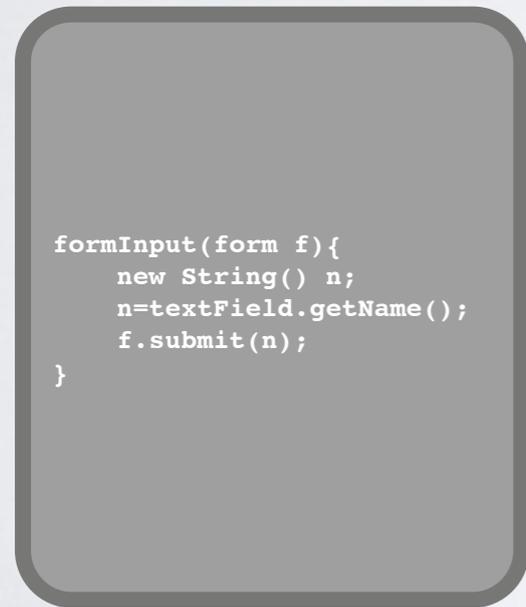

CONCEPTUAL MODEL

A user's **conceptual model** (also called a **mental model**) is his or her view of a system as s/he *believes it to be*, especially concerning how s/he can act upon it and what the system's responses mean.

MODEL MATCHING

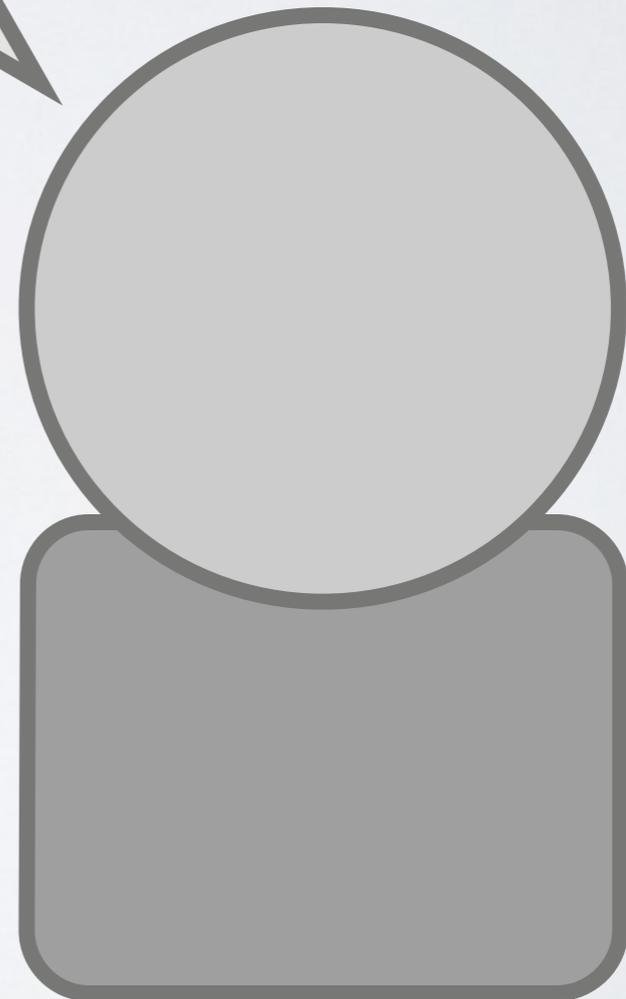

CONCEPTUAL
MODEL

IMPLEMENTATION
MODEL

MANIFEST MODEL

MODEL FORMATION

As a user interacts, his/her conceptual model is revised whenever s/he must **explicitly revisit it**, usually because of a **breakdown** such as unfulfilled expectations or unclear representations.

During a breakdown, the conceptual model is revisited as the system with which we interact goes from **ready-to-hand** to **present-at-hand**.

MODEL FORMATION

According to Heidegger

Ready-to-hand (*zuhanden*)

Our normal involvement with tools, where we neither notice them nor theorize about them and instead regard them casually or not at all as we attempt to achieve something.

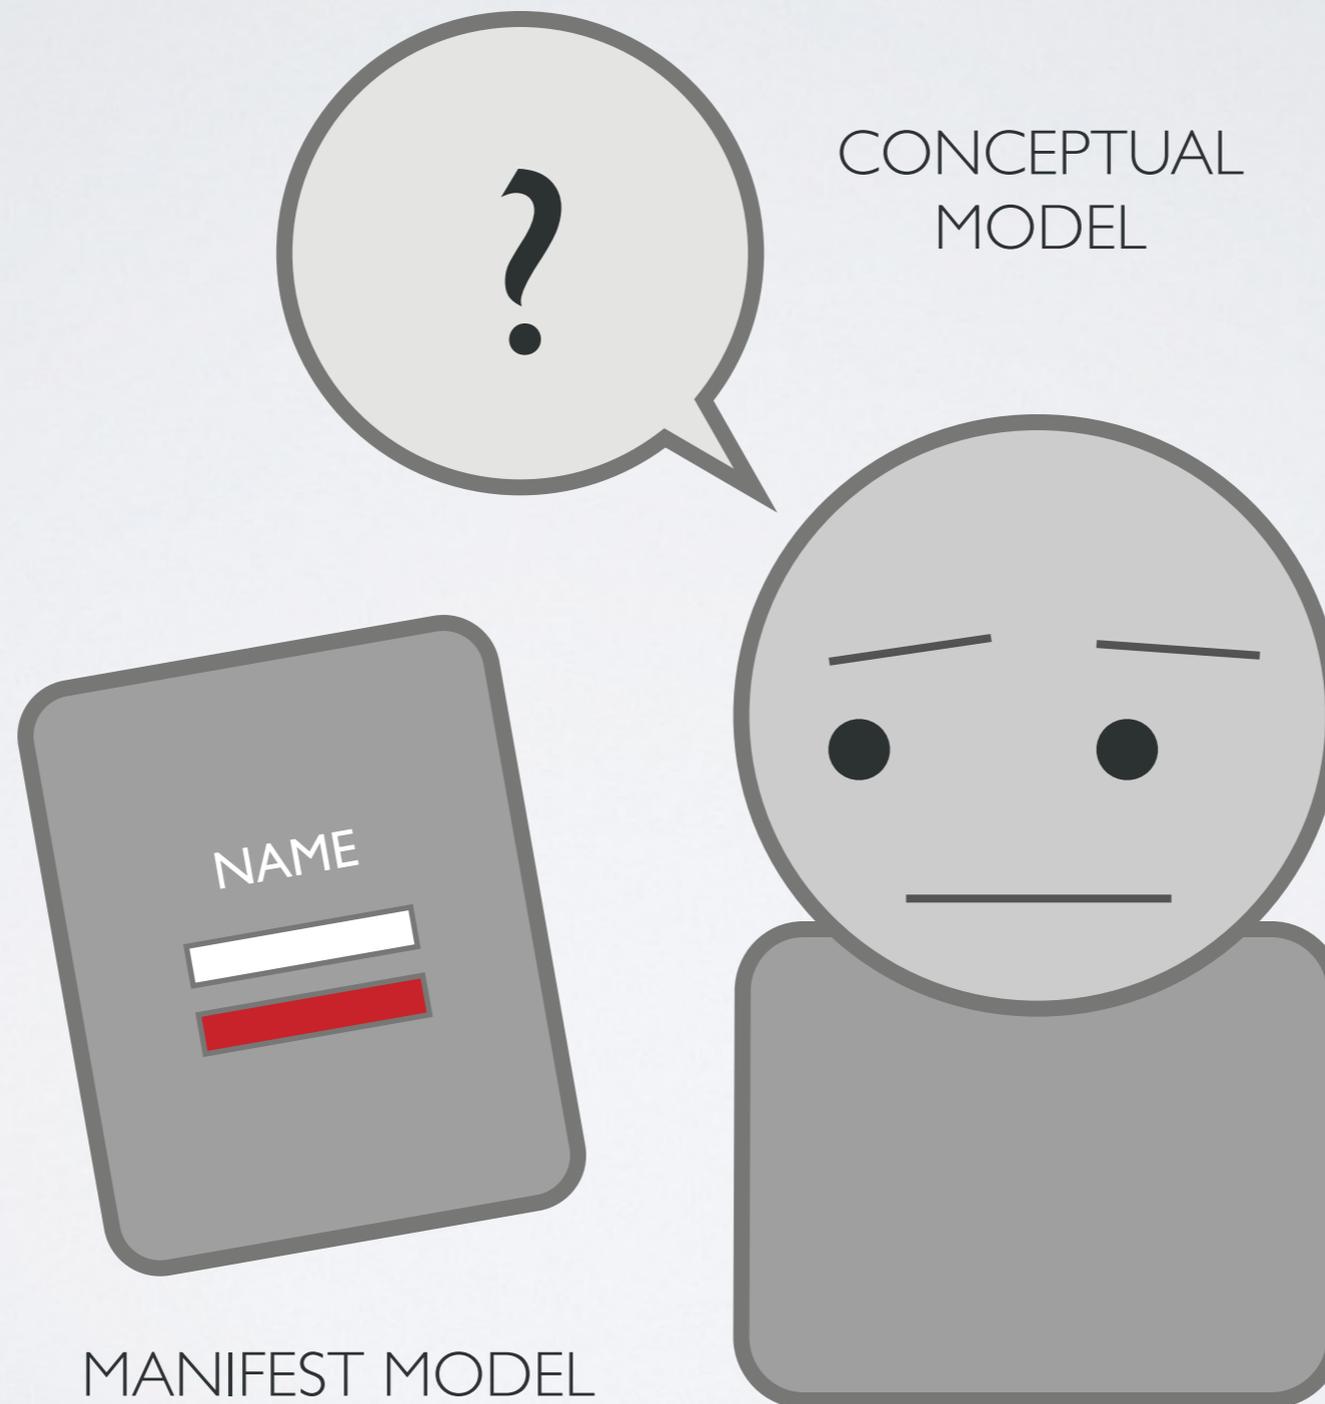

Present-at-hand (*vorhanden*)

The moment we truly notice something as it leaps into view, standing apart from any utility or purpose, just as a thing in itself.

This often occurs during a “breakdown” in use.

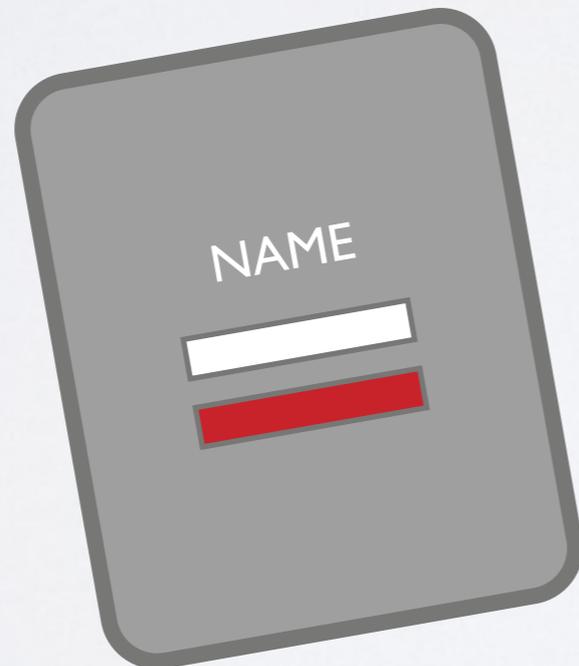

PRESENT-AT-HAND

READY-TO-HAND

CONCEPTUAL
MODEL

MANIFEST MODEL

MODEL FORMATION

Users will struggle until their **mental model matches the manifest model** of the system.

Constantly revising one's conceptual model can be painful.

Pay close attention next time you start using a technology that is new to you.

MODEL FORMATION

Best designs instantly form conceptual models using:

Consistency

Predictability

Visibility

Matching the system to the task

To the way people think about doing a thing.

User-centered concepts, not system-centered ones

HOW CAN WE FACILITATE
THE FORMATION OF
CONCEPTUAL MODEL?

CONCEPTUAL MODELS

Conceptual models are informed by many things:

Metaphors

Modes

Affordances

Constraints

Mappings

Prior experiences

Expectations

DESIGN ELEMENTS

Prior experiences

METAPHORS

METAPHORS

Metaphors help “**jump start**” users’ conceptual models by pre-populating them with ideas.

Great, but how do we apply metaphors?

Often new technologies begin as metaphors of old ones.

Can you think of some?

METAPHORS

Cars were “horseless carriages.”

Trains were “iron horses.”

Radio was called “wire-less.”

The first word processor was called “**the Electric Pencil.**”

the electric pencil II™
©1980 Michael Shroyer
for the TRS-80 Model II* Computer

The Electric Pencil is a Character Oriented Word Processing System. This means that text is entered as a continuous string of characters and is manipulated as such. This allows the user maximum freedom and ease in the movement and handling of text. Since lines are not delineated, any number of characters, words, lines or paragraphs may be inserted or deleted anywhere in the text. The entirety of the text shifts and opens up or closes as needed in full view of the user. Carriage returns as well as word hyphenation are not required since each line of text is formatted automatically.

As text is typed and the end of a screen line is reached, a partially completed word is shifted to the beginning of the following line. Whenever text is inserted or deleted, existing text is pushed down or pulled up in a wrap around fashion. Everything appears on the video display screen as it occurs thereby eliminating any guesswork. Text may be reviewed at will by variable speed or page-at-a-time scrolling both in the forward and reverse directions. By using the search or the search and replace function, any string of characters may be located and/or replaced with any other string of characters as desired. Specific sets of characters within encoded strings may also be located.

When text is printed, The Electric Pencil automatically inserts carriage returns where they are needed. Numerous considerations of Line Length, Page Length, Character Spacing, Line Spacing and Page Spacing allow for any form to be handled. Right justification gives right-hand margins that are even. Pages may be numbered as well as titled.

the electric pencil
—A Proven Word Processing System

The TRSDOS versions of The Electric Pencil II are our best ever! You can now type as fast as you like without losing any characters. New TRSDOS features include word left, word right, word delete, bottom of page numbering as well as extended cursor controls for greater user flexibility. BASIC files may also be written and simply edited without additional software.

Our CP/M versions are the same as we have been distributing for several years and allow the CP/M user to edit CP/M files with the addition of our CONVERT utility for an additional \$3.00. CONVERT is not required if only quick and easy word processing is required. A keyboard buffer permits fast typing without character loss.

Features
TRSDOS or CP/M Compatible • Supports Floppy Disk Drives • Dynamic Print Formatting • Double, NEC & Game Print Packages • Multi-Column Printing • Print Value Chaining • Page-at-a-time Scrolling • Bidirectional Multiplexed Scrolling • Subsystem with Print Value Scoreboard • Automatic Word & Record Number Tally • Global Search & Replace • Full Margin Control • End of Page Control • Non Printing Text Connecting • Line & Paragraph Indentation • Centering • Underlining • Boldface

VISA MasterCard

*TRSDOS is a registered trade mark of Tandy Brands, a division of Tandy Corp.

XEROX STAR (1979)

STAR SCREEN

STAR SCREEN

XEROX 6085 Workstation

User-Interface Design

To make it easy to compose text and graphics, to do electronic filing, printing, and making all at the same workstation, requires a revolutionary user interface design.

Fit-map display - Each of the pixels on the 19" screen is mapped to a bit in memory, thus, arbitrarily complex images can be displayed. The 6085 displays all fonts and graphics as they will be printed. In addition, familiar office objects such as documents, folders, file drawers and in-baskets are portrayed as recognizable images.

The mouse - A unique pointing device that allows the user to quickly select any text, graphic or office object on the display.

See and Point

All functions are visible to the user on the keyboard or on the screen. The user does filing and retrieval by selecting them with the mouse and touching the word, COPY, DELETE or PROPERTY on the screen keys. Text and graphics are edited with the **CTRL** keys.

Shorter Production Times:

Experiences at Xerox with prototype work stations has shown shorter production times and thus lower costs, as a function of the percentage of use of the workstations. The following equation can be used to express this:

Text and Graphics

To replace typesetting, the 6085 offers a choice of type fonts and sizes from 6 point to 36 point.

Here is a test piece of 36 point text.
 Here is a sentence of 18 point text.
 18-point text.
 24-point text.
 36-point text.

Table 1: Percentages of use of workstations

Year	Non-uses	uses
1978	45.2	45.8

PROBLEMS W/ METAPHORS

Metaphors can be powerful and make interfaces easier to learn, but . . .

They can **limit designers' creativity.**

They can reduce the advantages of software.

If they are shallow, inappropriate, or mixed they can be **misleading** more than helpful.

They can be overly “cute” at the expense of functional.

They can be **culturally specific.**

They can result in **slower interactions or performance.**

MODES

WHAT ARE MODES?

Modes are “**switches**” that change the state of an interactive system such that the same actions have different effects.

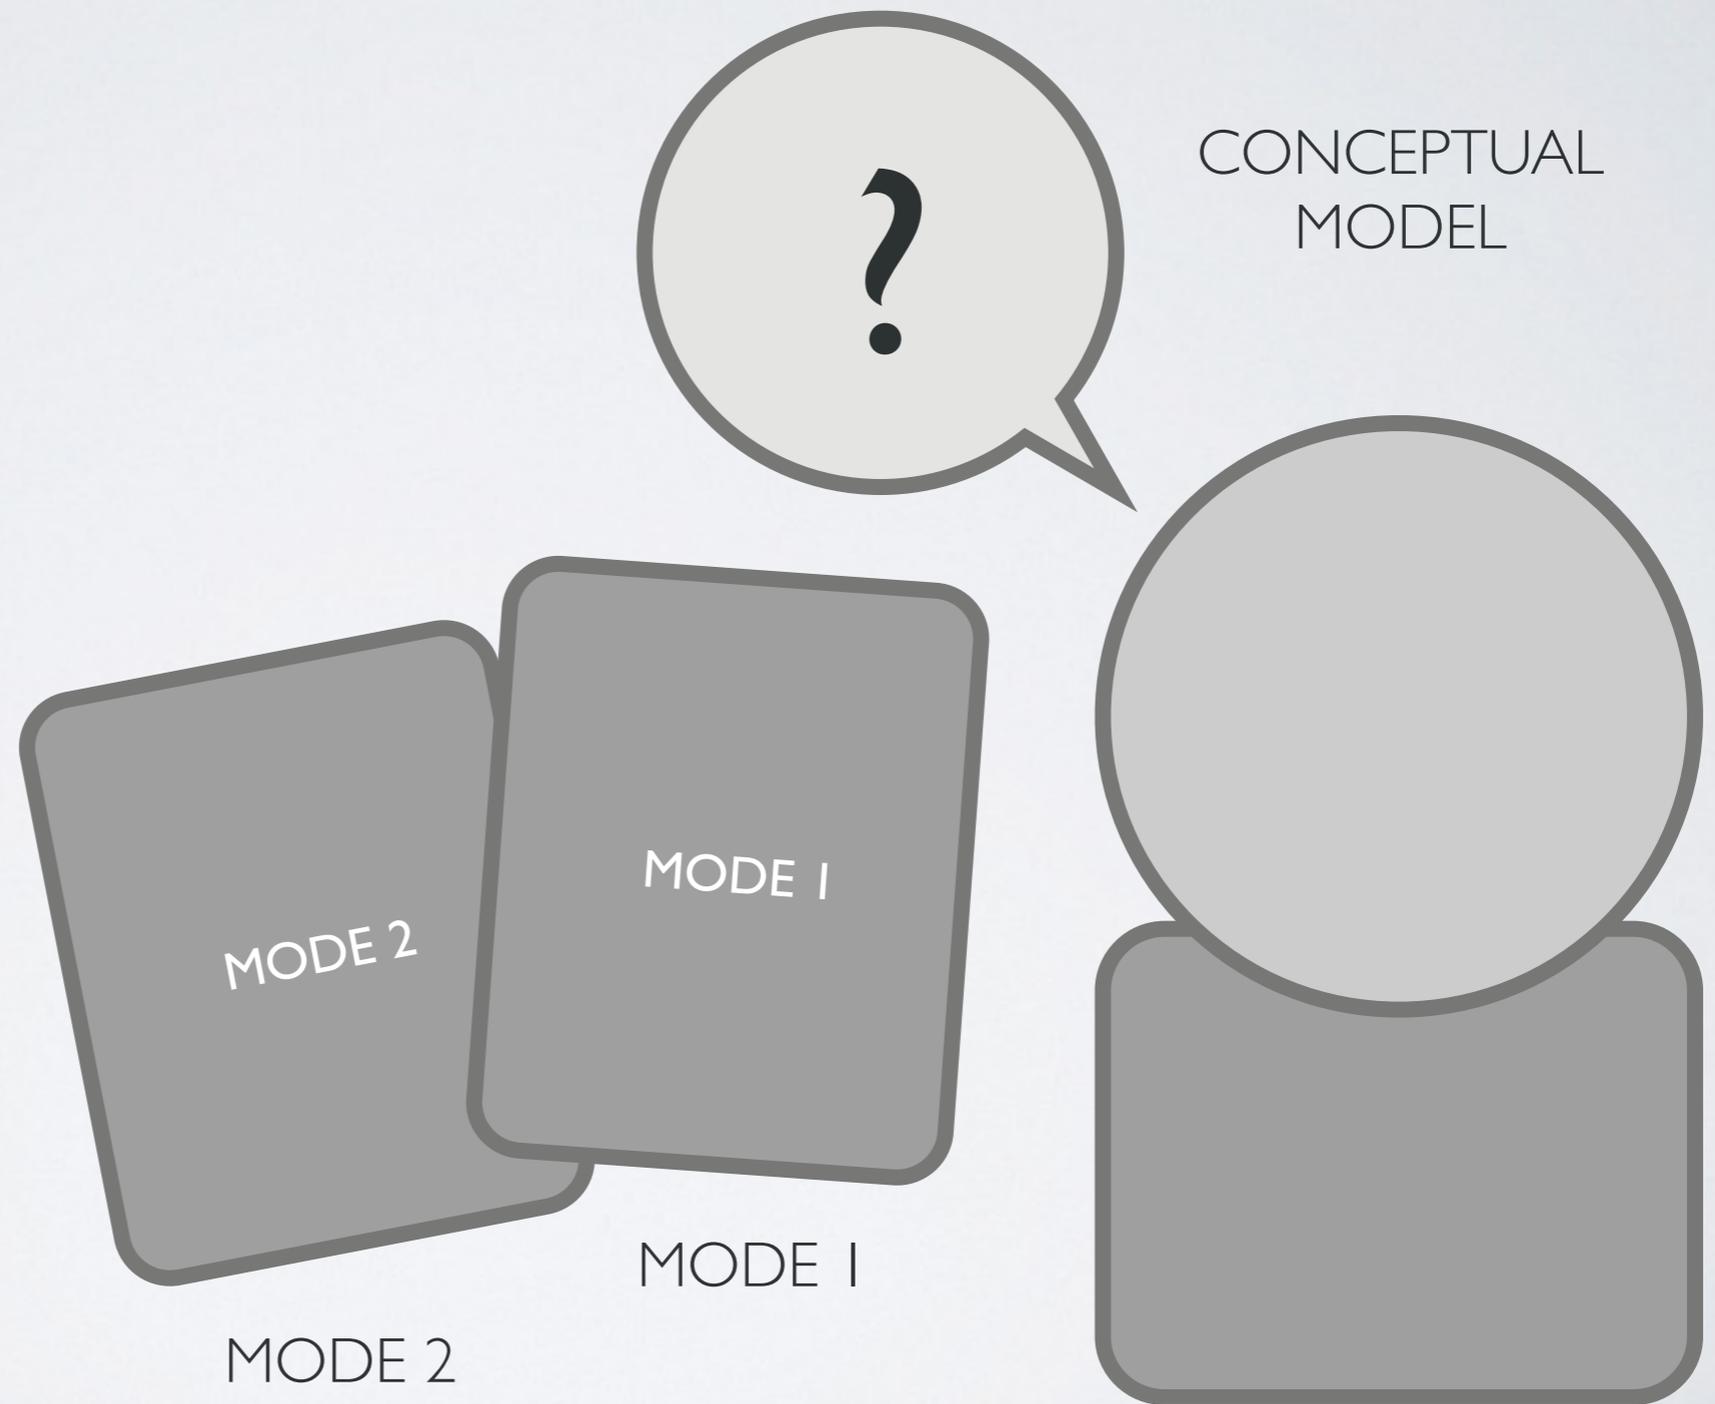

What are some examples?

```
lenovo@ubuntu: ~/Desktop/www
127.0.1.1 ubuntu
# The following lines are desirable for IPv6 capable hosts
::1      ip6-localhost ip6-loopback
fe00::0  ip6-localnet
ff00::0  ip6-mcastprefix
ff02::1  ip6-allnodes
ff02::2  ip6-allrouters
ff02::3  ip6-allhosts
127.0.0.1 localhost clho
~
~
~
:w !sudo tee %
[sudo] password for lenovo: █
```

The image shows a terminal window with a dark purple background. The terminal output displays IPv6 configuration details. A network utility window is overlaid on the terminal, showing a circular icon and a vertical scale with the number '454'. A yellow box with a black border is positioned over the terminal, containing the text 'Edit in Quick Mask Mode (Q)'.

MODES & MODELS

EXAMPLES

CAPS LOCK

“Why is it needed? I'm always hitting it by accident... The keyboard is the most bizarre, ridiculous, non-designed monstrosity foisted on the American public. We've put huge amounts of effort into the design of things you see on the screen, but the keyboard seems handed down by God – and it's an evil god.”

— *Don Norman*

ACTIVE VS. PASSIVE MODES

An **active mode** is one that requires constant action to maintain. Once that action has retired, so does the mode.

E.g., Shift.

A **passive mode** is one that requires action to set, and requires a separate action to unset, or to set again.

E.g., CAPS LOCK.

Generally, active modes are preferred. Why?

What are drawbacks of passive modes?

What are drawbacks of active modes?

USE OF MODES

Modes are often discouraged. But when are they useful?

When the means for control are outnumbered by the number of necessary outcomes.

Imagine a keyboard with distinct keys for lowercase and capital letters.

If you are going to have a mode, it is imperative that its status and activation are **visible**.

Modes in command line interfaces are dangerous for this reason.

Modes should be **invertible**.

If I can get to mode B from mode A, I should be able to get back to mode A from mode B, ideally with the same action (e.g., toggle).

VI

Thank
you!

VI "Cheat" Sheet
ACNS Bulletin ED-03
February 1995

vi Editor "Cheat Sheet"

Invoking vi: `vi filename`
Format of vi commands: `[count][command]` (count repeats the effect of the command)

Command mode versus input mode

Vi starts in command mode. The positioning commands operate only while vi is in command mode. You switch vi to input mode by entering any one of several vi input commands. (See next section.) Once in input mode, any character you type is taken to be text and is added to the file. You cannot execute any commands until you exit input mode. To exit input mode, press the escape (**Esc**) key.

Input commands (end with Esc)

a	Append after cursor
i	Insert before cursor
o	Open line below
O	Open line above
:r <i>file</i>	Insert <i>file</i> after current line

Any of these commands leaves vi in input mode until you press **Esc**. Pressing the **RETURN** key will not take you out of input mode.

File management commands

:w <i>name</i>	Write edit buffer to file <i>name</i>
:wq	Write to file and quit
:q!	Quit without saving changes
ZZ	Same as :wq
:sh	Execute shell commands (<ctrl>d)

Window motions

<ctrl>d	Scroll down (half a screen)
<ctrl>u	Scroll up (half a screen)
<ctrl>f	Page forward
<ctrl>b	Page backward
/string	Search forward
?string	Search backward
<ctrl>l	Redraw screen
<ctrl>g	Display current line number and file information
n	Repeat search

AFFORDANCES

AFFORDANCES

Ecological approach to psychology

“The affordances of the environment are what it offers animals, what it provides or furnishes, for good or ill.”

— J. J. Gibson (1977)

“The term ‘affordance’ refers to **the perceived and actual properties** of the thing, primarily those fundamental properties that determine just **how the thing could possibly be used.**”

— Don Norman (1988)

IN OTHER WORDS

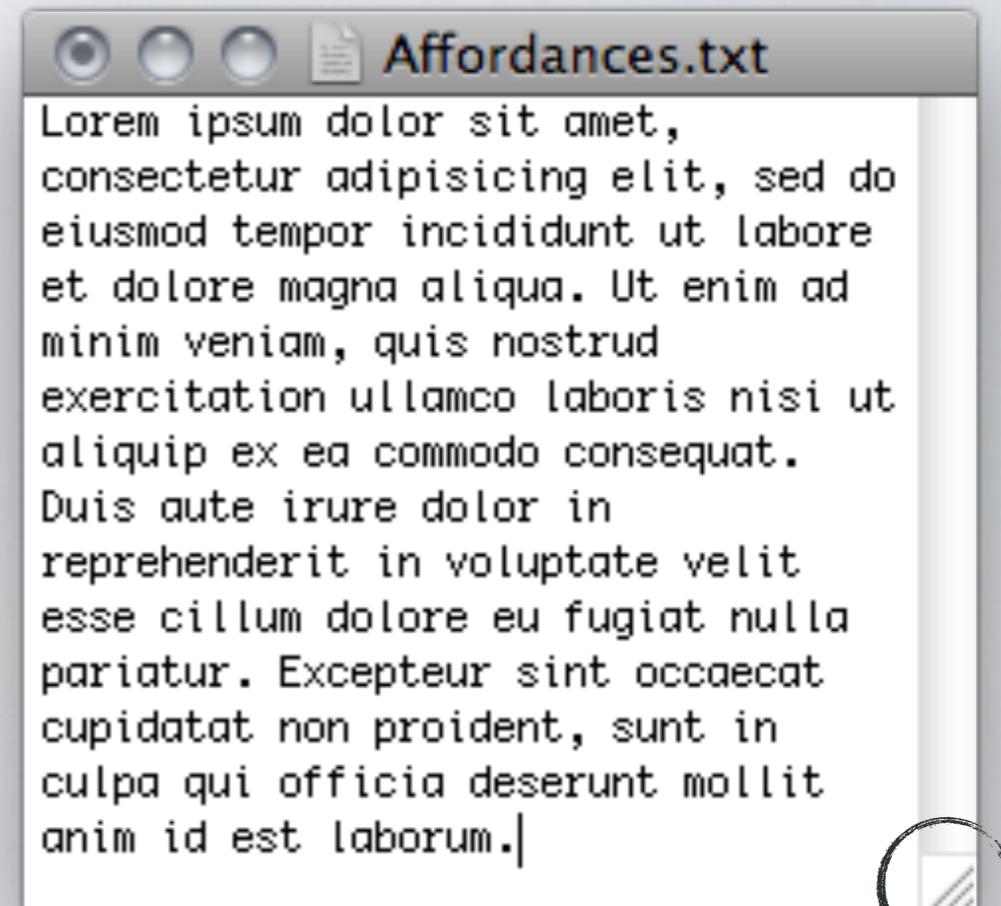

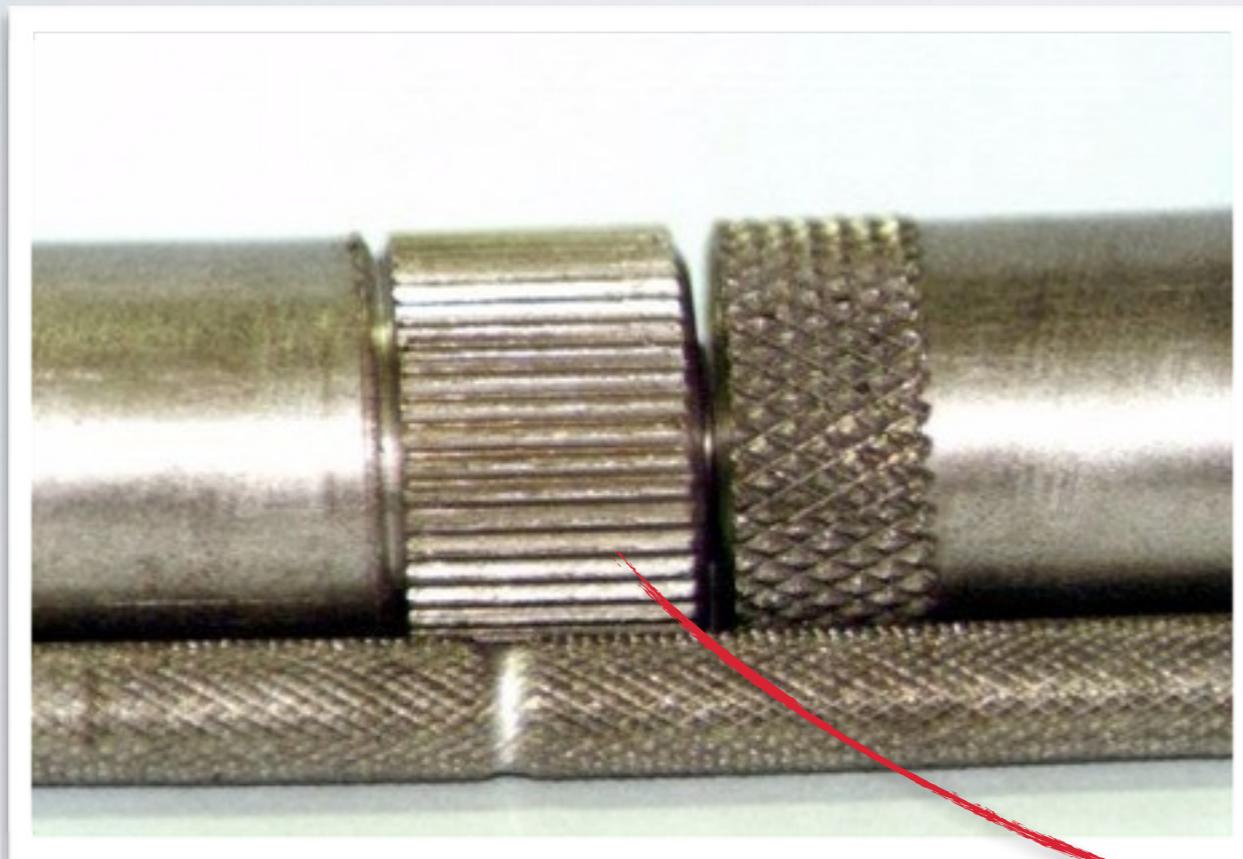

What does a thing communicate to people regarding how it can be used?

Often by **visual appearance**.

How a thing seems should tell us how the thing can be used.

Whether how it **seems** it can be used and how it **actually** must be used match is a design question.

AN EXAMPLE

Knurling provides a visual affordance for "gripping."

MORE DEFINITIONS

“People perceive the environment directly in terms of its **potentials for action.**”

“An affordance of an object ... refers to attributes of both the object and the actor.”

“In general, **when the apparent affordances of an artifact matches its intended use, the artifact is easy to operate.** When apparent affordances suggest different actions than those for which the object is designed, errors are common.”

— William Gaver (1991)

METAPHORS VS. AFFORDANCES

Metaphors are meant to “jump start” a user’s conceptual model for a system.

Affordances are meant to “jump start” a user’s conceptual model for interaction with an artifact in the environment.

I.e., “Metaphors” for low-level interaction.

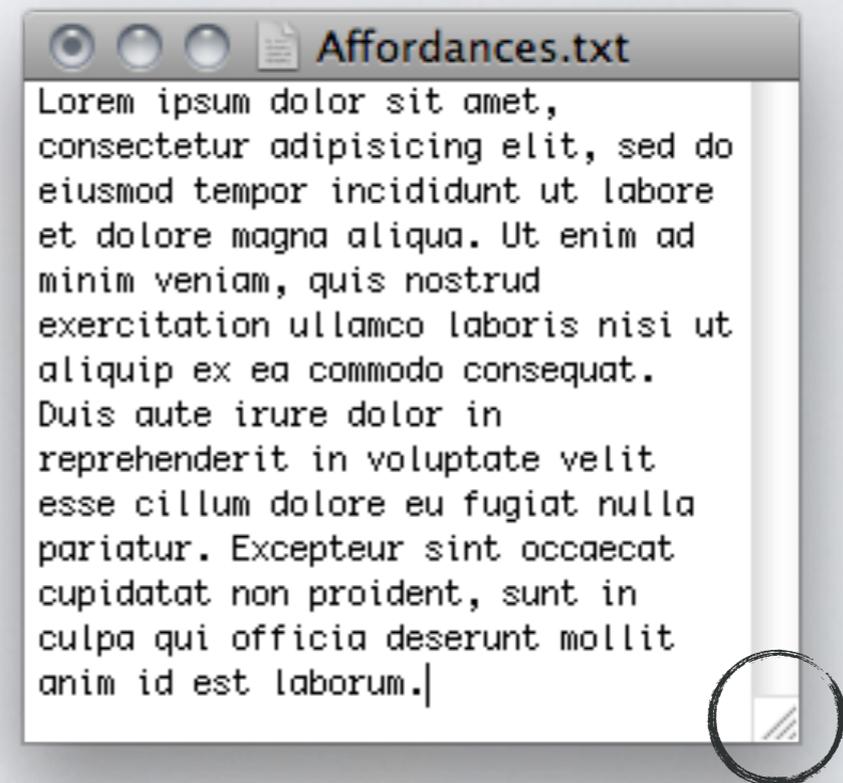

As with metaphors, if affordances are designed poorly, they can be damaging to a correct conceptual model.

DIFFERENT TYPES OF AFFORDANCE

PERCEPTIBLE AFFORDANCE

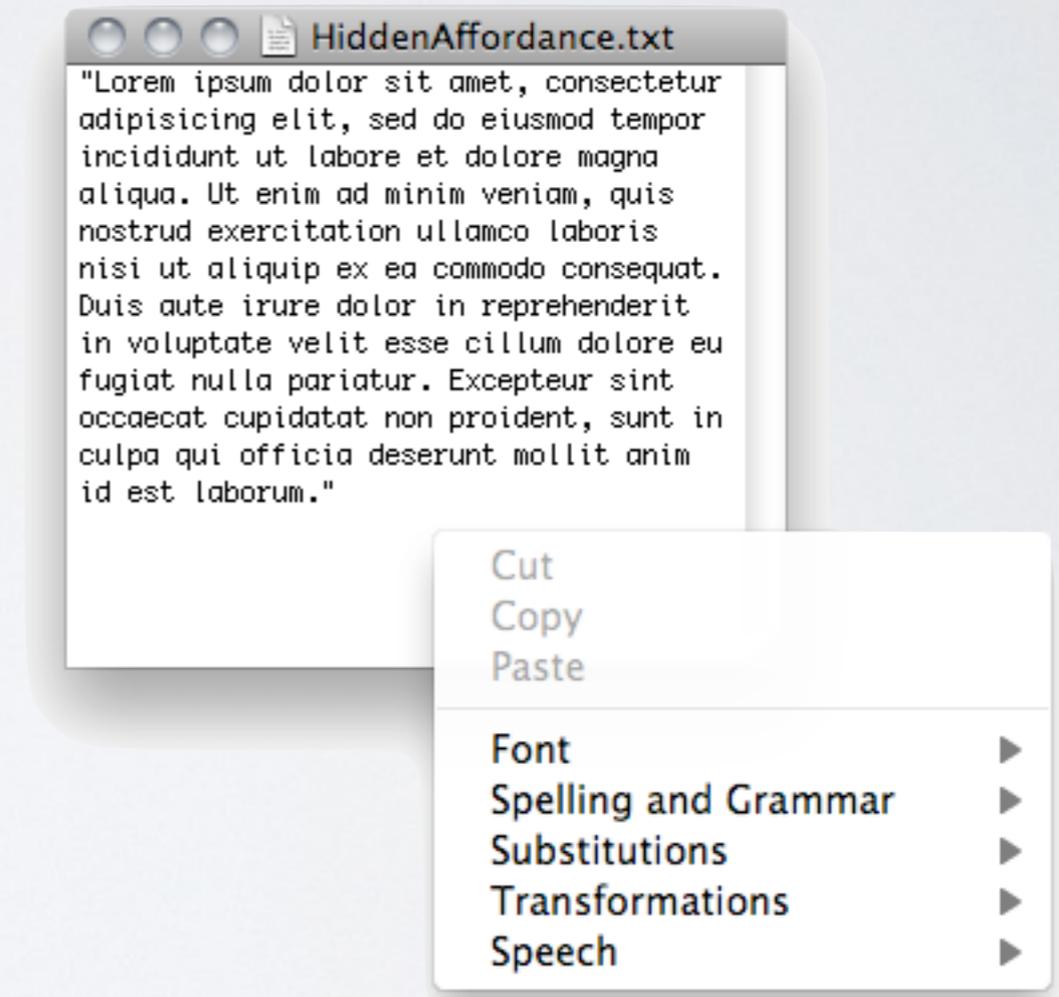

When there is perceptual information for an existing affordance.

Knurling in an example, assuming you can actually move and resize the window with it.

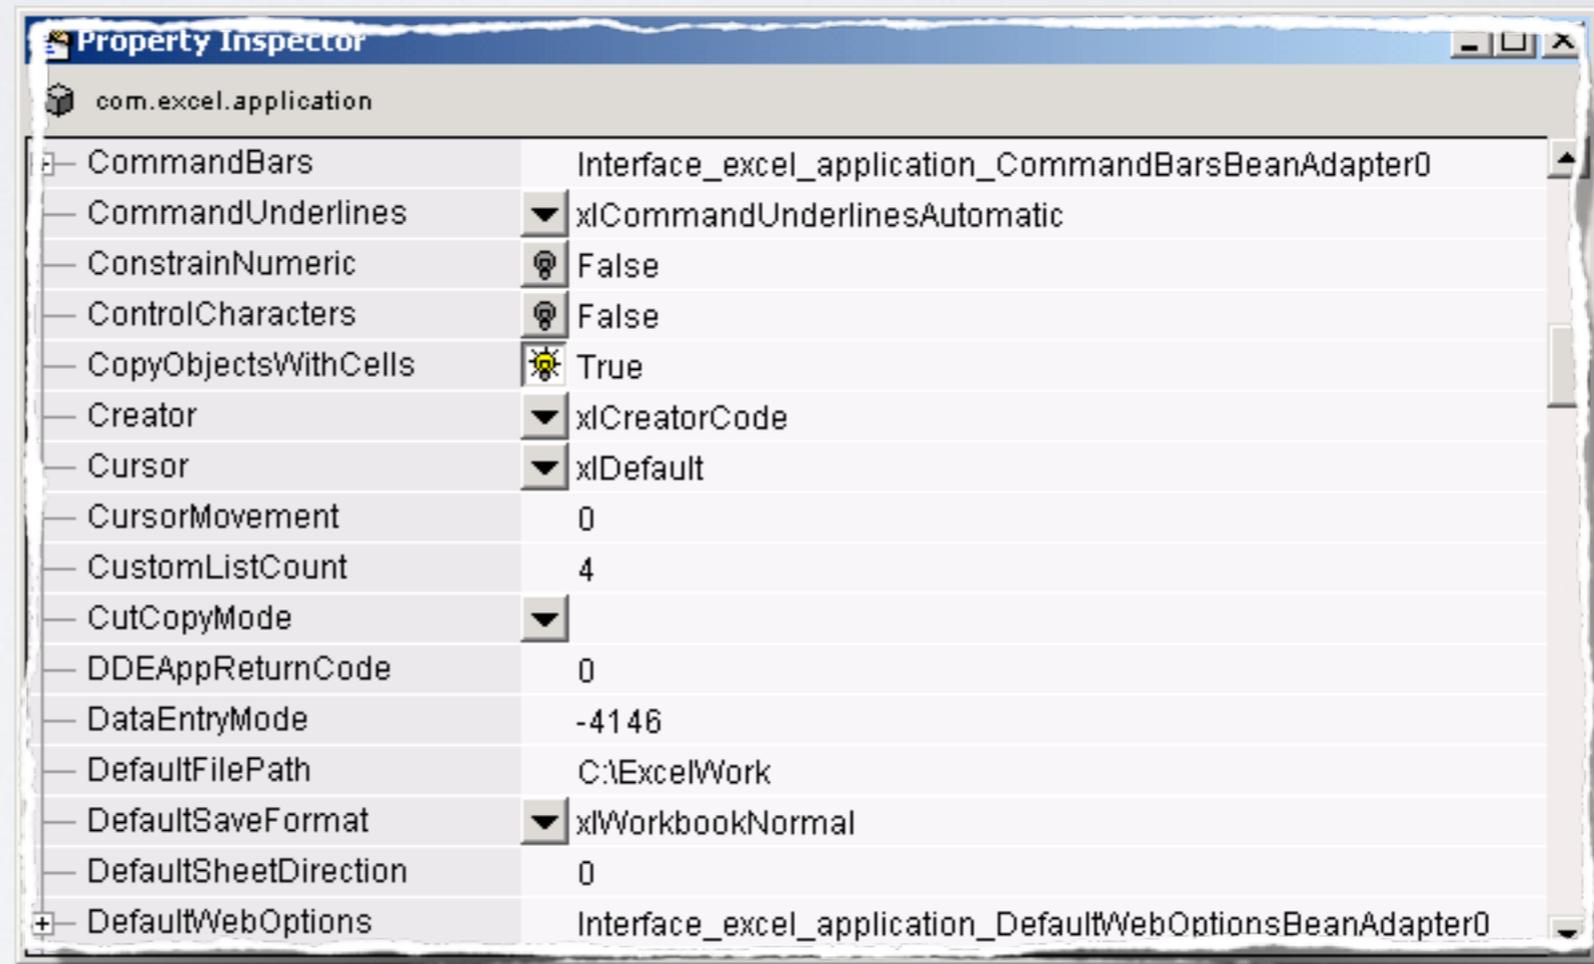

HIDDEN AFFORDANCE

When there is **not** perceptual information for an existing affordance.

FALSE AFFORDANCE

When there is perceptual information for an affordance that does not exist.

FALSE AFFORDANCES

FALSE AFFORDANCES

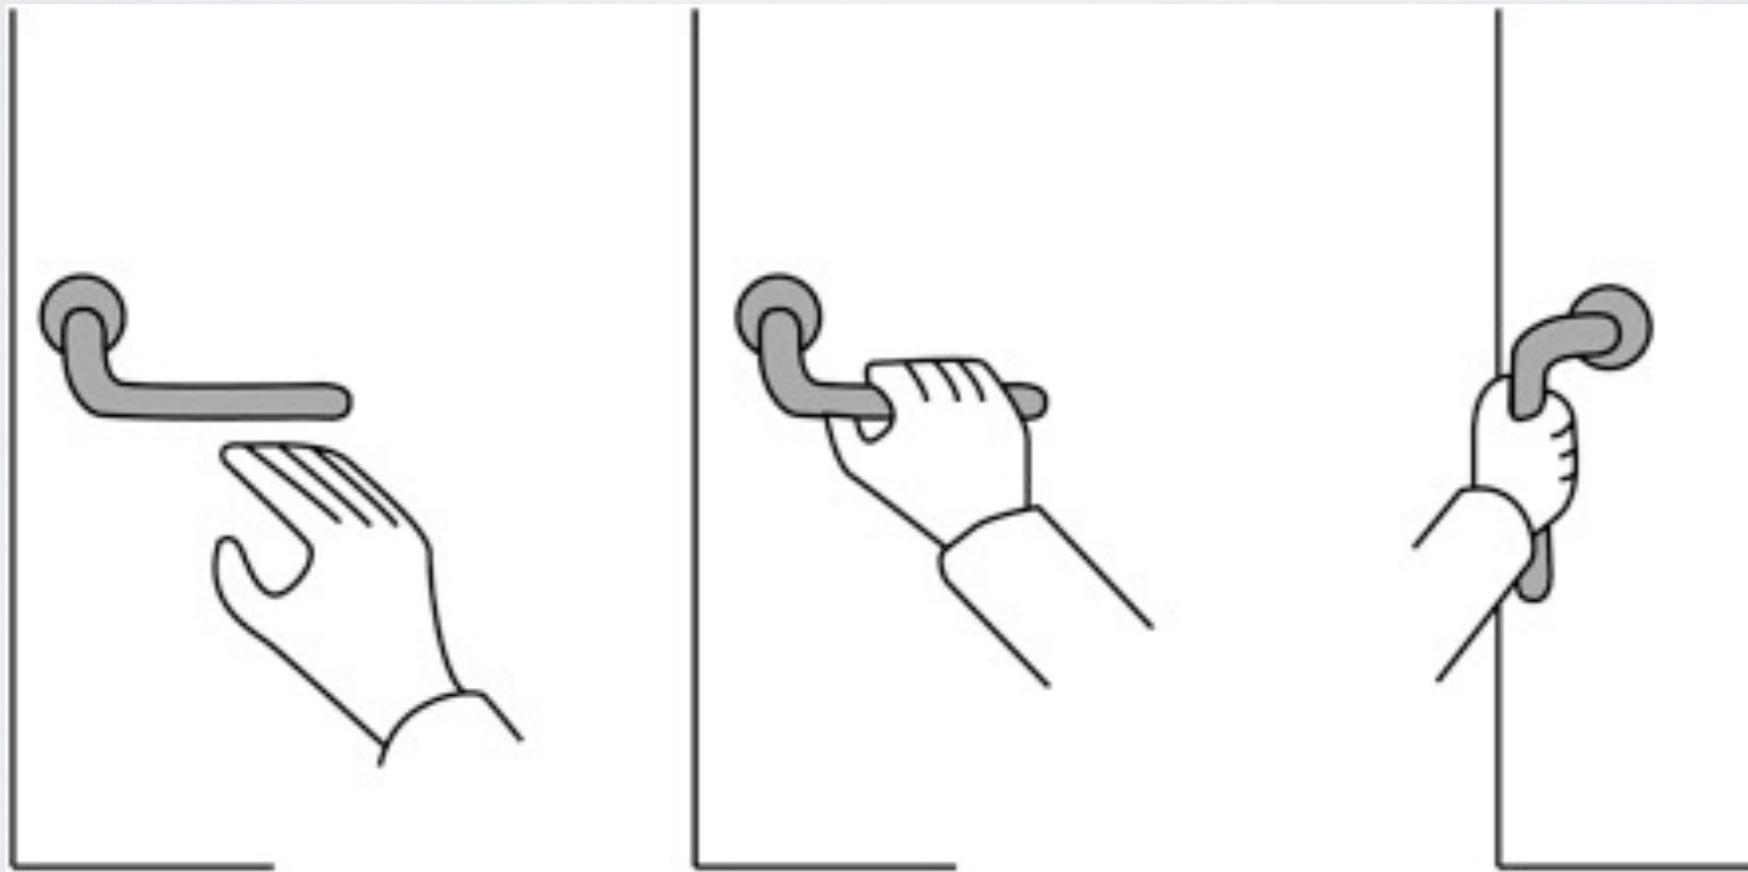

CONSISTENT AFFORDANCES

SEQUENTIAL AFFORDANCE

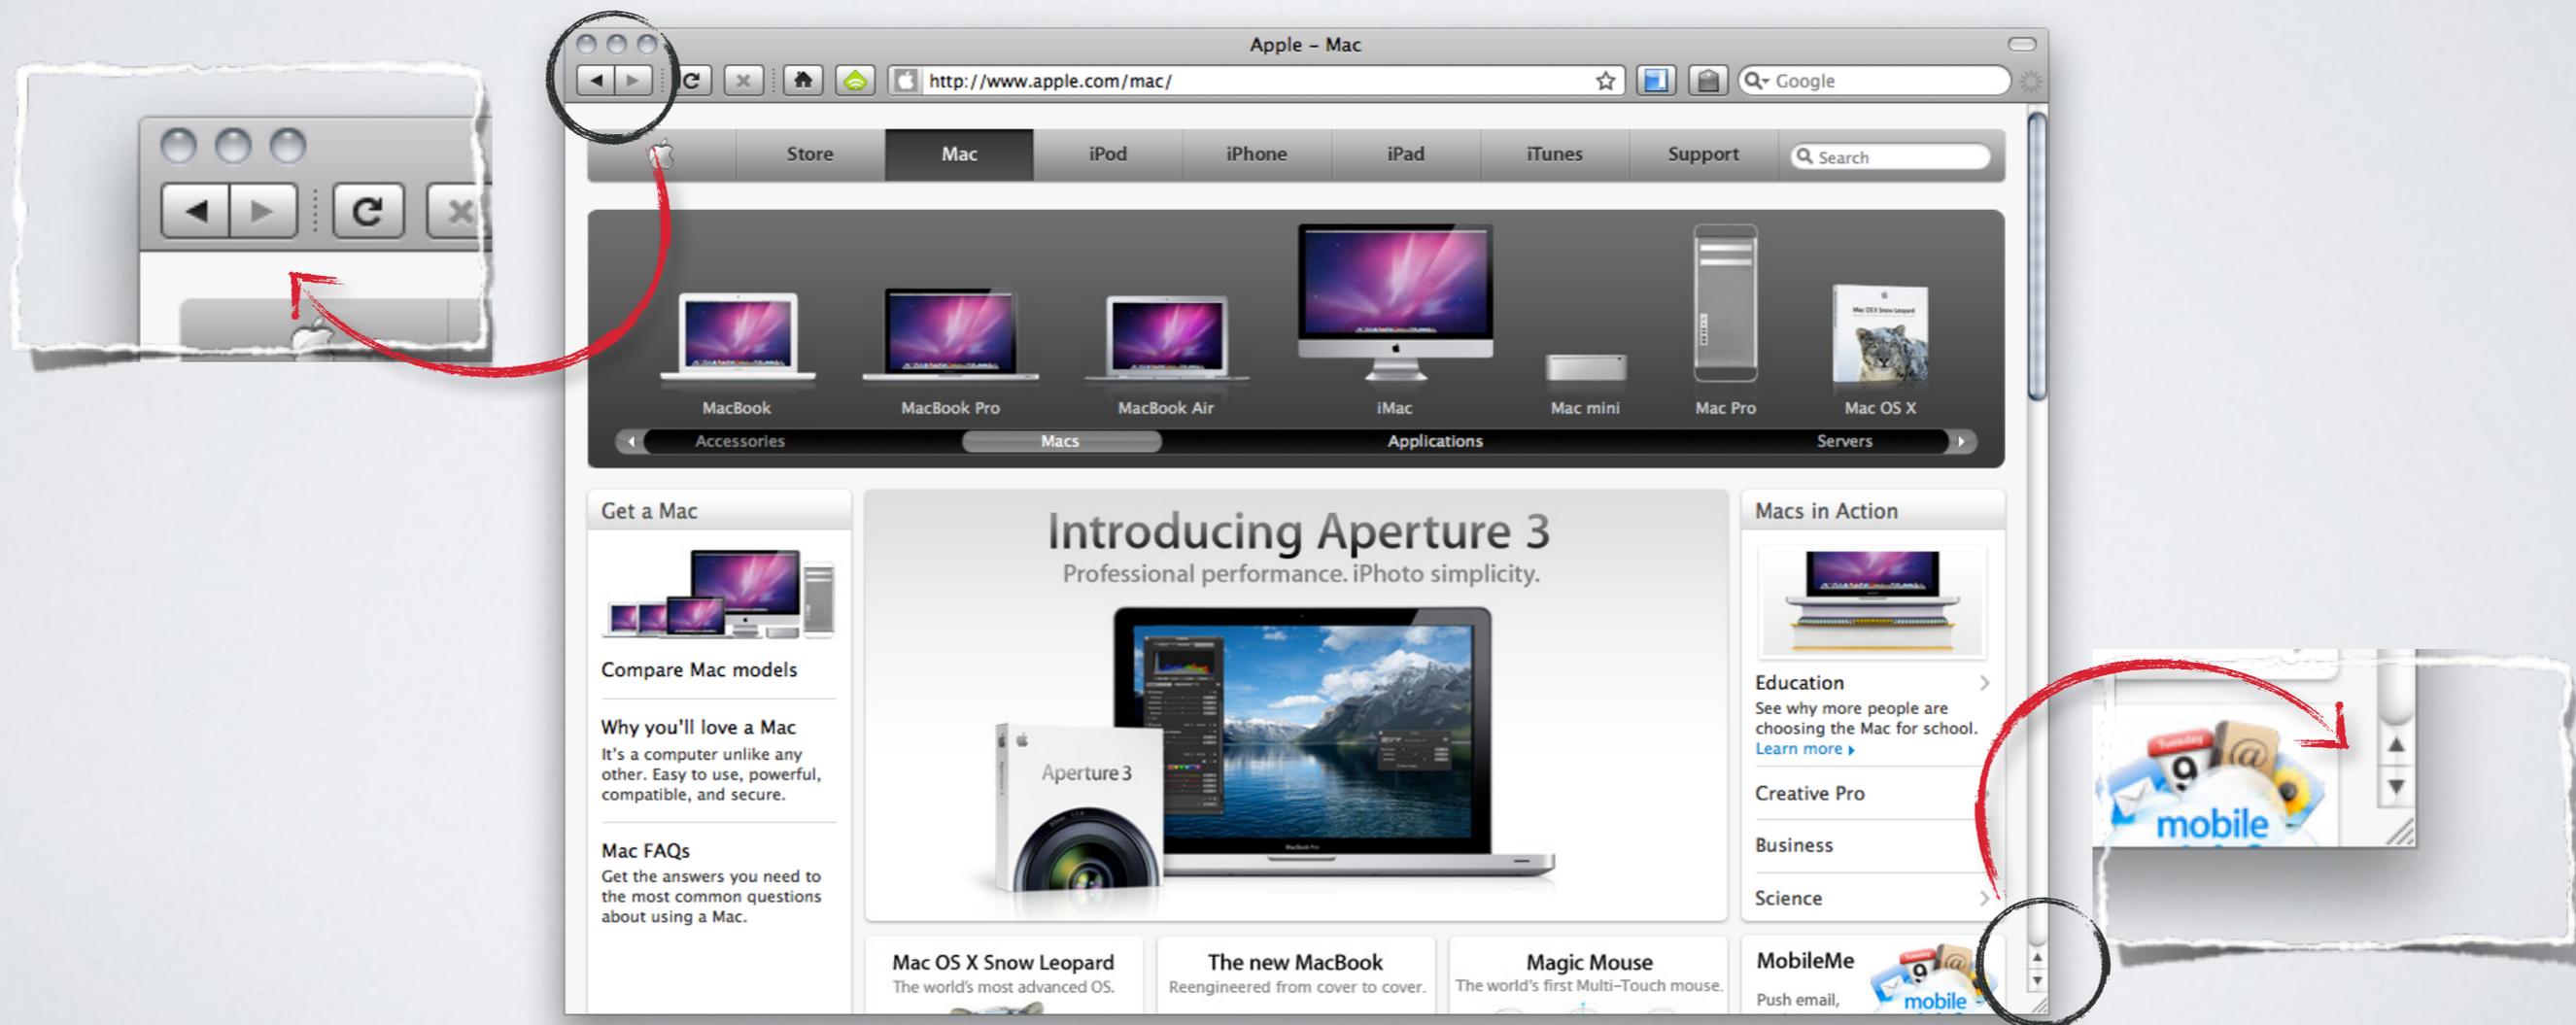

Acting on a perceptible affordance leads to information indicating new affordances.

NESTED AFFORDANCES

Affordances due to **spatial** relationships reveal what actions can be done.

Affordances that combined reveal a specific associated action

AFFORDANCES & CONVENTIONS

“Note also that affordances are not intrinsic, but depend on the background and culture of users. Most computer-literate user will click on an icon. This is not because they go around pushing pictures in art galleries, but because they have **learned that this is an affordance** of such objects in a computer domain...”

— Dix et al. (2004)

“Designers sometimes will say that when they put an icon, cursor, or other target on the screen, they have added an ‘affordance’ to the system. This is a misuse of the concept. ... It is wrong to claim that the design of a graphical object on the screen ‘affords clicking’ ... Yes, the object provides a target and it helps the user know where to click and maybe even what to expect in return, but those aren’t affordances, those are conventions, and feedback, and the like. ... **Don’t confuse affordances with conventions.**”

— Norman

Icons do not afford “pushing” or “clicking.” Icons do not communicate “pushability” by their attributes. They do not give an indication of their intended use, except by convention.

VISIBILITY & FEEDBACK

Two sides of the execution/evaluation coin.

Visibility — Can I see what I need to in order to take appropriate action?

Feedback — Do I receive appropriate information about actions that I am taking or have taken?

Crucial pieces of direct manipulation interfaces.

Visibility of objects.

Feedback for all actions.

Most affordances depend on visibility.

Most metaphors depend on visibility.

THREE KINDS OF VISIBILITY

Must have visibility:

1. Of objects of interest.
2. Of available actions.
3. Of system status.

Affordances address the first two.

Feedback addresses the third.

FEEDBACK

At all times, the system indicates what state it is in.

Examples:

Hourglass icon

Progress bars

Chimes and sound alerts

DESIGN ELEMENTS

Metaphors ✓

Modes ✓

Affordances ✓

Constraints

Mappings

Prior experiences

CONSTRAINTS

CONSTRAINTS

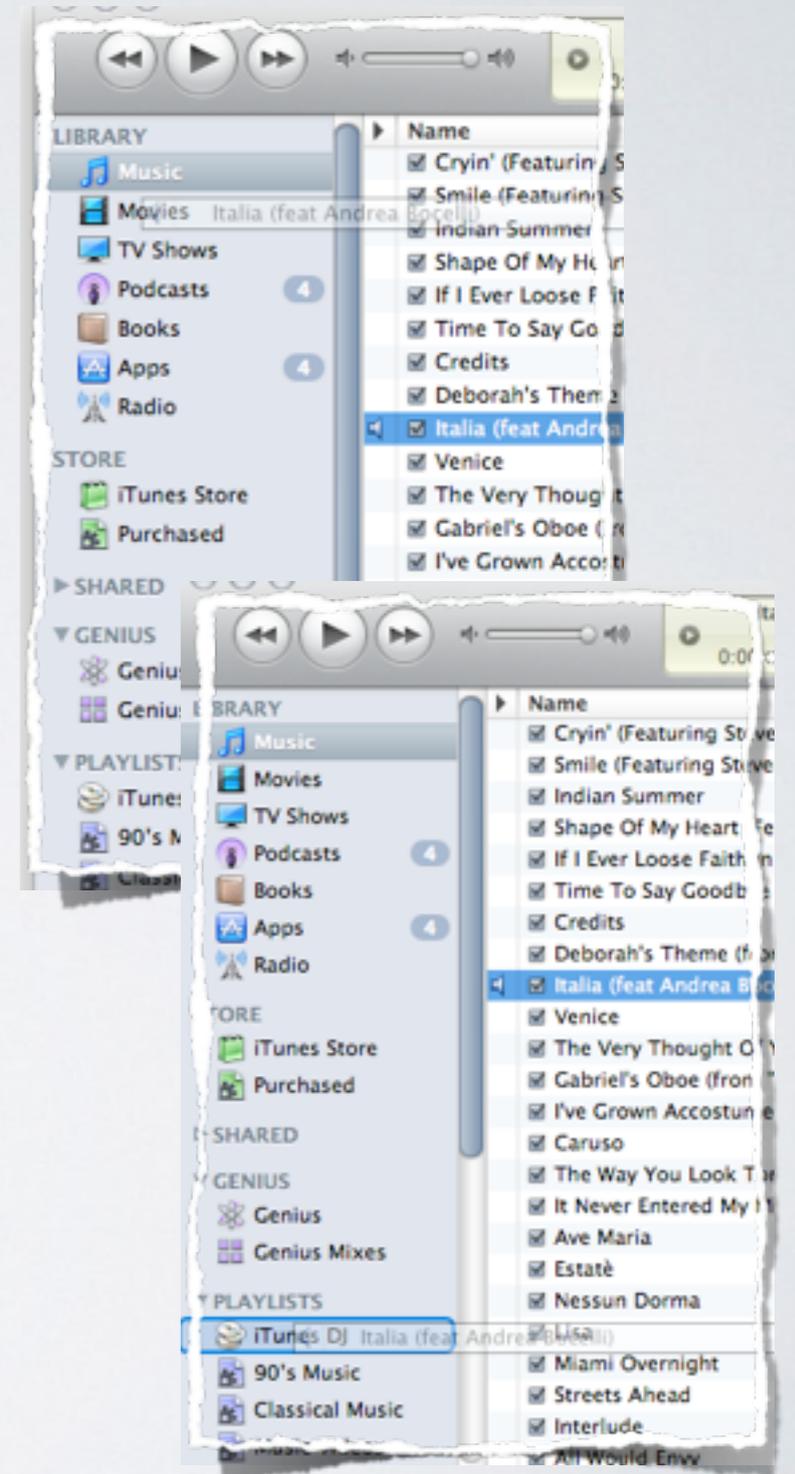

Constraints prevent some actions while allowing others.

Direct manipulation interfaces should employ these, permitting legal actions while making illegal ones visible through feedback.

Prevent errors before they can happen.

Disruptive error messages are a last resort. Instead, use constraints to prevent wrong behavior in the first place.

E.g., Windows cannot be dragged to where you cannot retrieve them.

DESIGN ELEMENTS

Metaphors ✓

Modes ✓

Affordances ✓

Constraints ✓

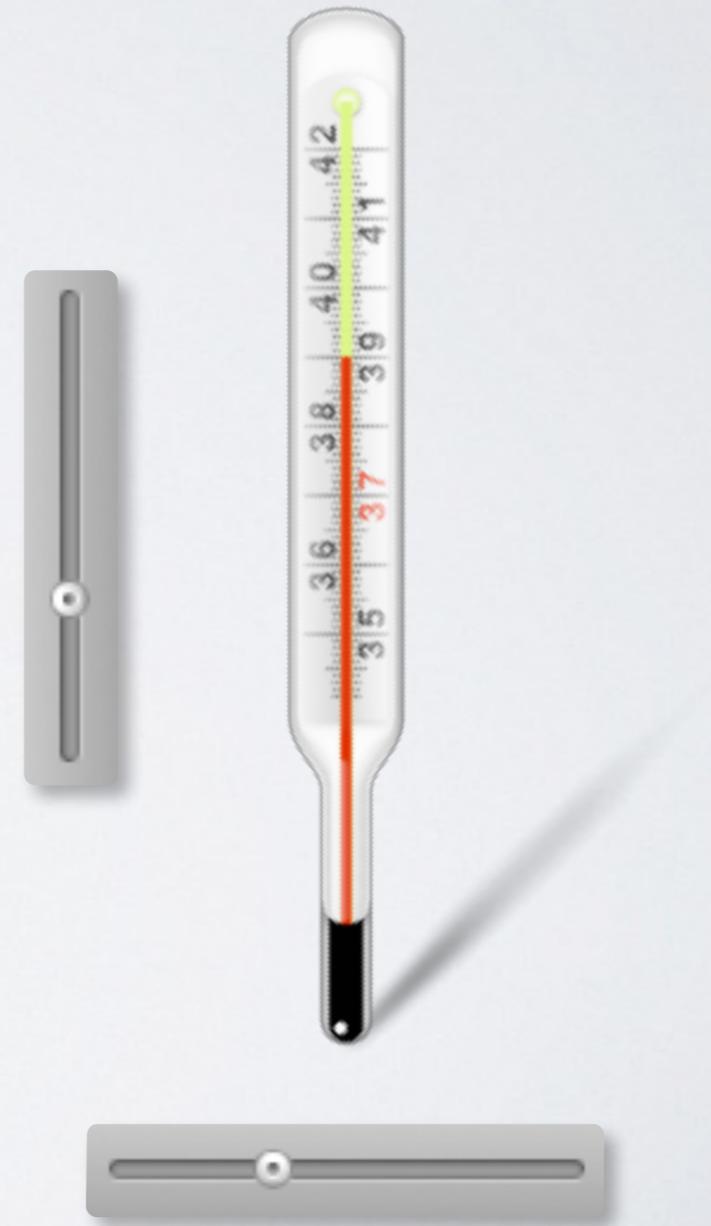

Mappings

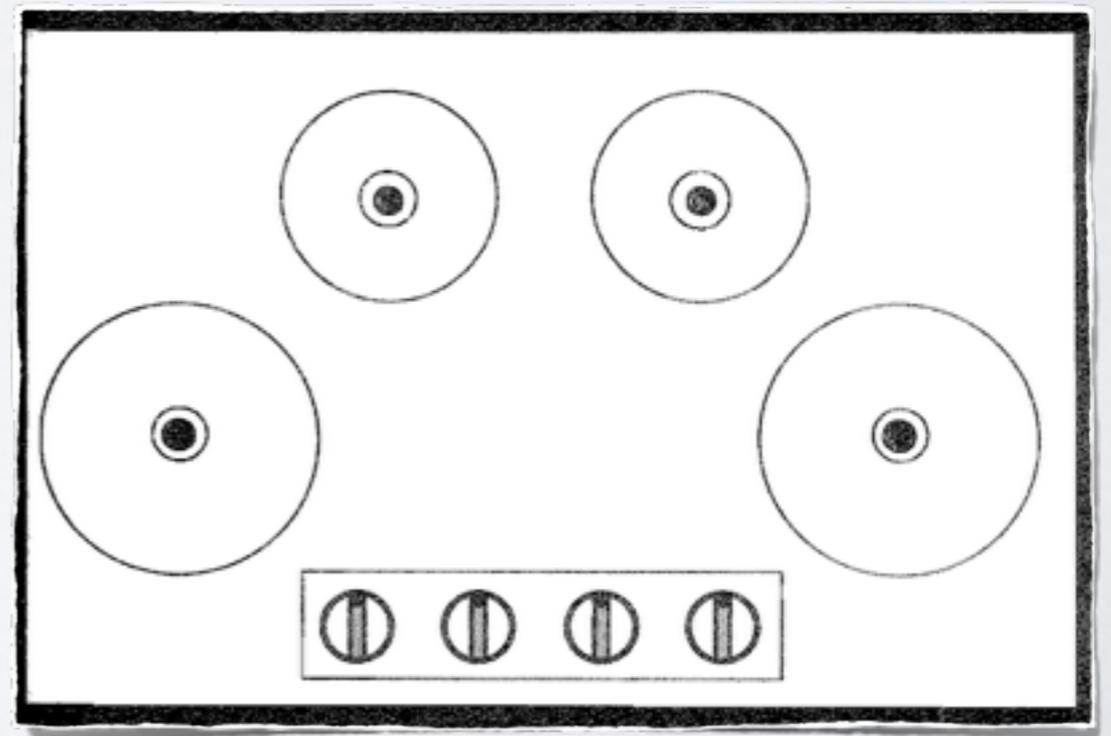

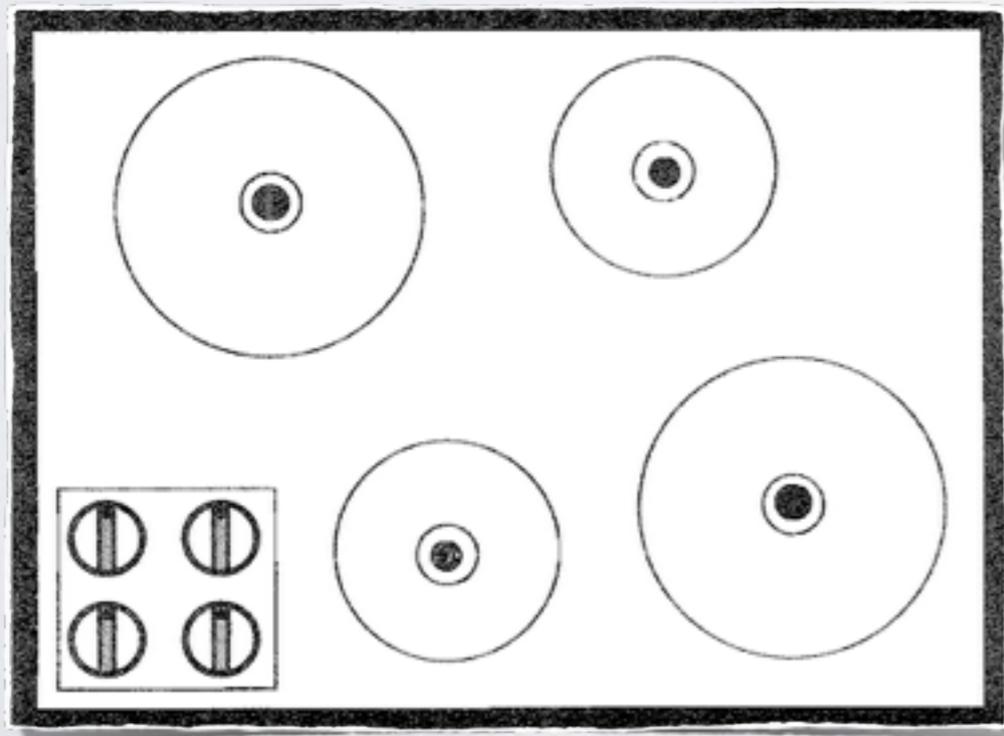

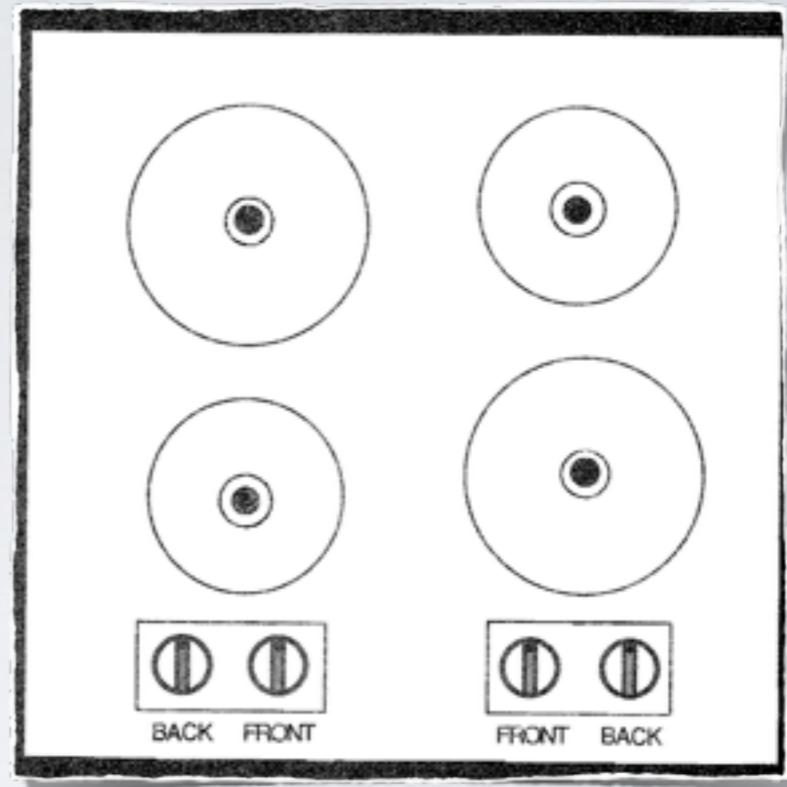

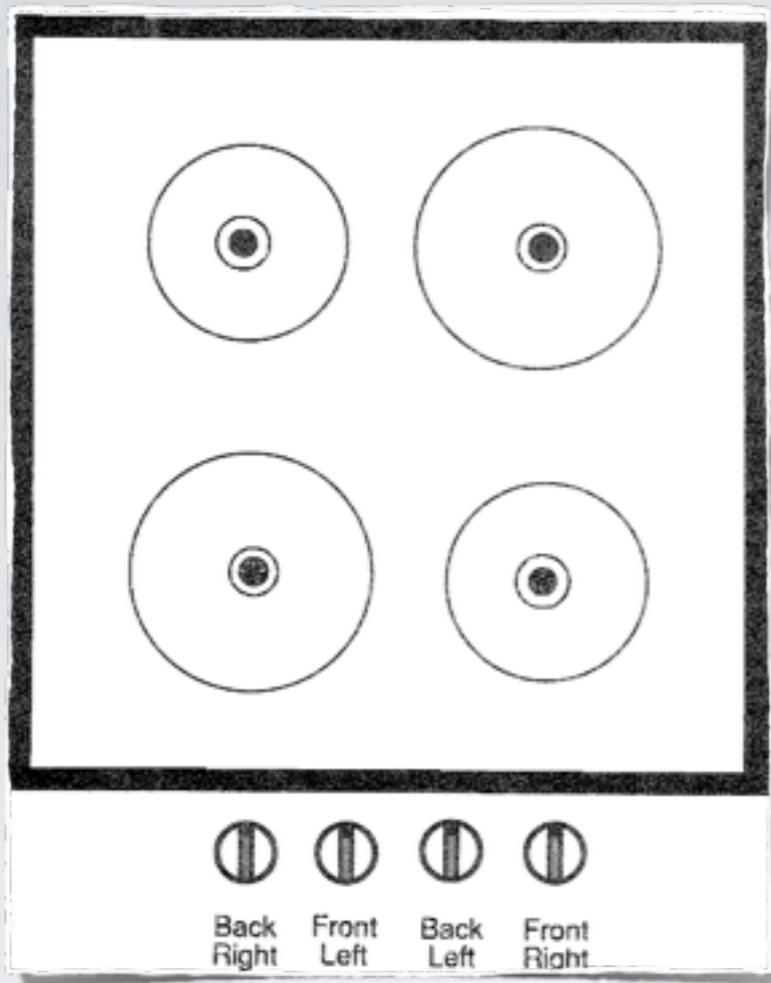

Prior experiences

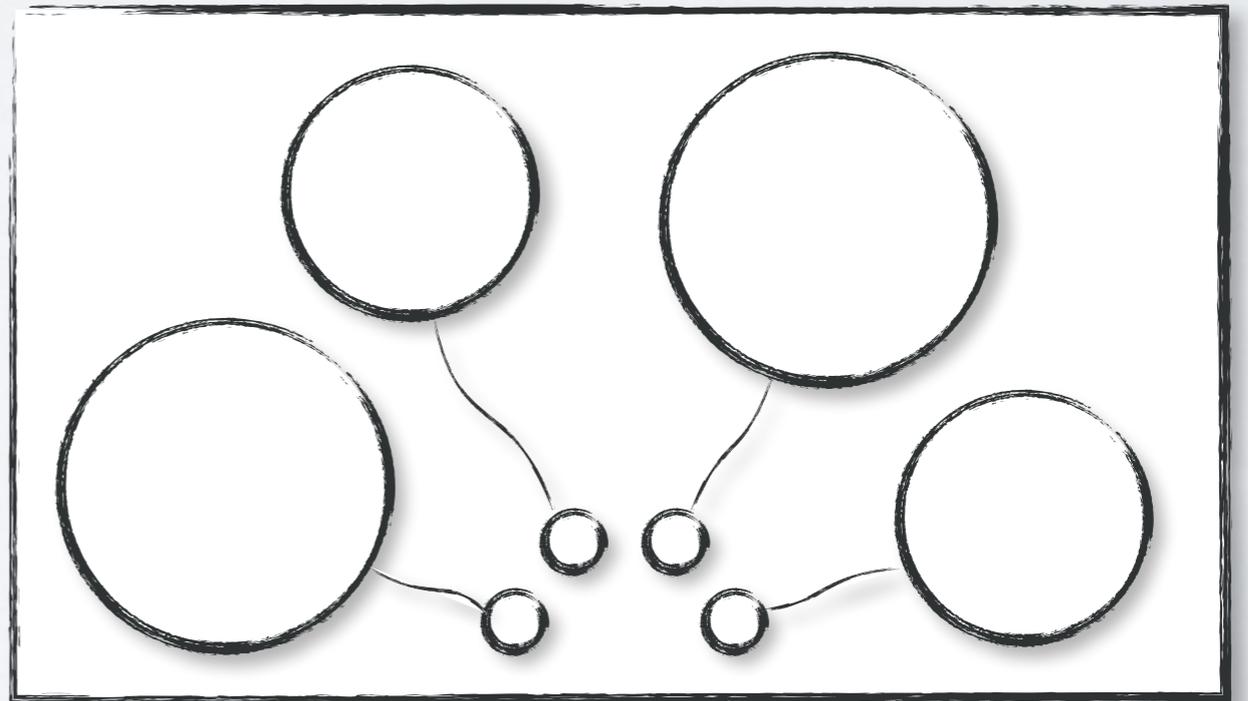

MAPPINGS

NATURAL MAPPINGS

Use physical, spatial, or other analogies to draw the connection between a control and the display or manipulation of an object.

NATURAL MAPPINGS

Minimize the number of cognitive steps to transform action into effect, or perception into comprehension.

Applicable to both action and displays (execution and evaluation).

Minimize the need for labels, instructions, help systems.

DESIGN ELEMENTS

Metaphors ✓

Modes ✓

Affordances ✓

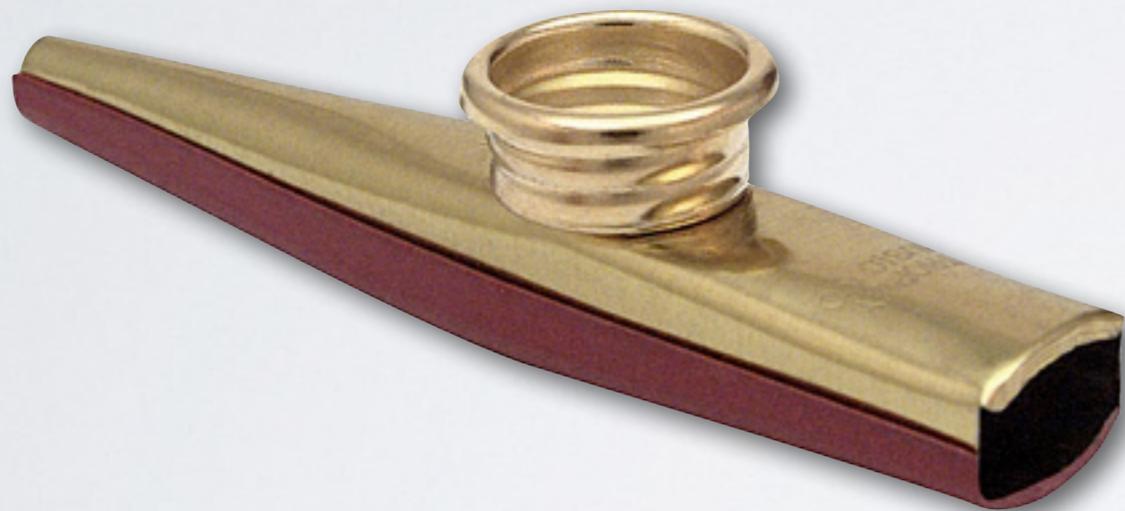

Constraints ✓

Mappings ✓

EXPERTS & NOVICES

WHAT IS MORE USABLE?

A kazoo

A violin

NOVICES

Unfamiliar with the system.

Possibly unfamiliar with the context and domain.

Often apprehensive about technology.

Often unwilling to explore interfaces for fear of inflicting permanent damage.

Confidence develops slowly at first.

Errors tend to be mistakes, not slips.

EXPERTS

Familiar with the system, context, and domain.

Usually comfortable with technology.

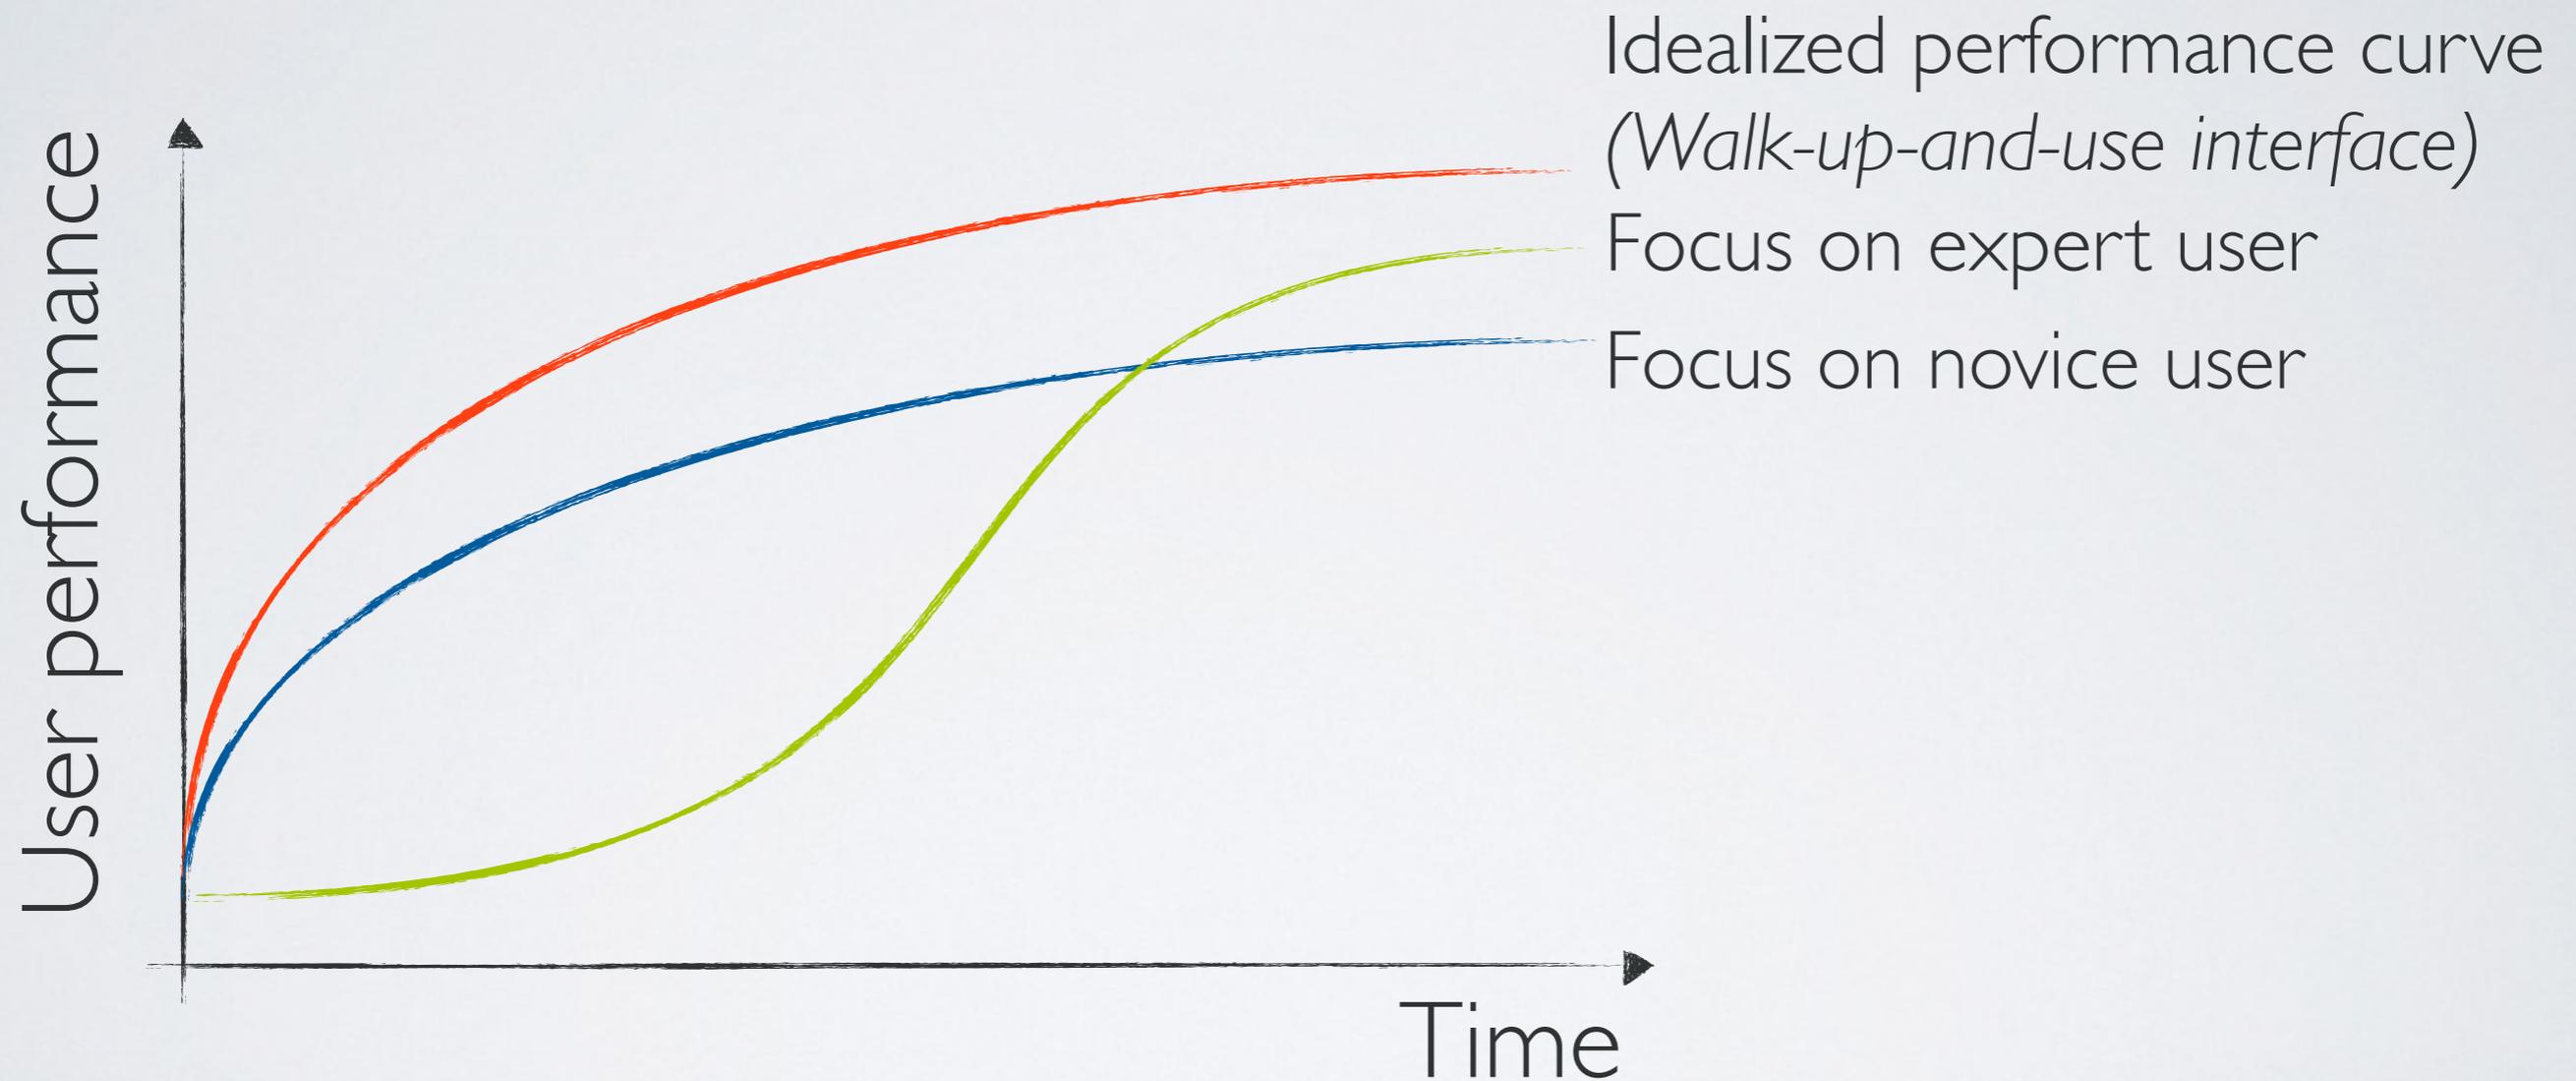

Willing to explore interfaces, try new things, teach themselves.

Rely heavily on undo.

Confidence develops quickly.

Errors tend to be slips, not mistakes.

EXPERTISE & PERFORMANCE

CAN WE ACCOMMODATE BOTH?

How can we smoothly transition from novice to expert use in the same system?

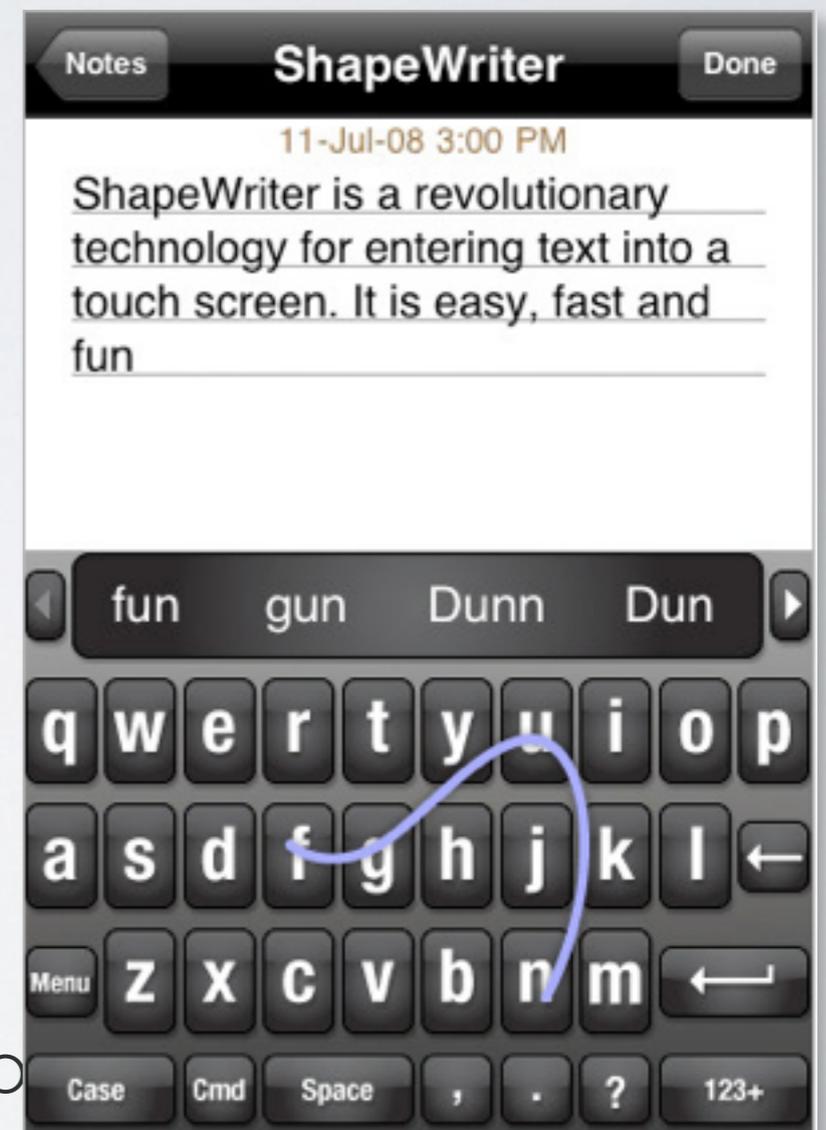

E.g., ShapeWriter

Can we include both novice and expert functionality in the same space?

E.g., Keyboard shortcuts, menu accelerators

Can adaptive user interfaces change dynamically over time?

We have to be careful that users still feel in control
