

# CS 540 Introduction to Artificial Intelligence

## **Search II: Informed Search**

Josiah Hanna  
University of Wisconsin-Madison

November 16, 2021

# Announcements

- **Homeworks:**
  - HW 8 due next Tuesday.
- **Class roadmap:**

Tuesday, Nov 16	Search II: Informed search		HW7 Due; HW8 Released
Thursday, Nov 18	Advanced Search and Review on Search		
<b>Everything below here is tentative and subject to change.</b>			
Tuesday, Nov 23	Games - Part I		HW8 Due; HW9 Released
Thursday, Nov 25	Happy Thanksgiving! (No class)		
Tuesday, Nov 30	Games - Part II		
Thursday, Dec 2	Reinforcement Learning I		HW9 Due; HW10 Released
Tuesday, Dec 7	Reinforcement Learning II		
Thursday, Dec 9	Review on Games and Reinforcement Learning		
Tuesday, Dec 14	Ethics and Trust in AI		HW10 Due

# Outline

- Uninformed vs Informed Search
  - Review of uninformed strategies, adding heuristics
- A\* Search
  - Heuristic properties, stopping rules, analysis
- Extensions: Beyond A\*
  - Iterative deepening, beam search

# Breadth-First Search

Recall: expand **shallowest** node first

- Data structure: queue
- **Properties:**
  - Complete
  - Optimal (if edge cost 1)
  - Time  $O(b^d)$ 
    - ← Depth
    - ← Branching Factor
  - Space  $O(b^d)$

# Uniform Cost Search

Like BFS, but keeps track of cost

- Expand least cost node
  - Data structure: priority queue
  - **Properties:**
    - Complete
    - Optimal (if cost lower bounded by  $\epsilon$ )
    - Time  $O(b^{C^*/\epsilon})$
    - Space  $O(b^{C^*/\epsilon})$
- ← Optimal goal path cost

Credit: DecorumBY

# Depth-First Search

Recall: expand **deepest** node first

- Data structure: stack
- **Properties:**
  - Incomplete (stuck in infinite tree...)
  - Suboptimal
  - Time  $O(b^m)$
  - Space  $O(bm)$

Max Depth

# Iterative Deepening DFS

## Repeated limited DFS

- Search like BFS, fringe like DFS
- **Properties:**
  - Complete
  - Optimal (if edge cost 1)
  - Time  $O(b^d)$
  - Space  $O(bd)$

**A good option!**

# Uninformed vs Informed Search

Uninformed search (all of what we saw). Know:

- Path cost  $g(s)$  from start to node  $s$
- Successors.

Informed search. Know:

- All uninformed search properties, plus
- Heuristic  $h(s)$  from  $s$  to goal

# Informed Search

Informed search. Know:

- All uninformed search properties, plus
- Heuristic  $h(s)$  from  $s$  to goal

- Use information to **speed up search**.

# Using the Heuristic

## Back to uniform-cost search

- We had the priority queue
- Expand the node with the smallest  $g(s)$ 
  - $g(s)$  “first-half-cost”

- Now let's use the heuristic (“second-half-cost”)
  - Several possible approaches: let's see what works

# Attempt 1: Best-First Greedy

One approach: just use  $h(s)$  alone

- Specifically, expand node with smallest  $h(s)$
- This isn't a good idea. Why?

Fringe	$h(s)$
A	3
B,C	2,1
B,G	2,0
A -> C -> G	

- Not optimal! **Get**  $A \rightarrow C \rightarrow G$ . **Want:**  $A \rightarrow B \rightarrow C \rightarrow G$

# Attempt 2: A Search

Next approach: use both  $g(s)$  +  $h(s)$  alone

- Specifically, expand node with smallest  $g(s)$  +  $h(s)$
- Again, use a priority queue
- Called “A” search

Fringe	$g(s) + h(s)$
A	3
B,C	1001,1000
B,G	1001,1000

A -> C -> G

- **Still not optimal!** (Does work for former example).

# Attempt 3: A\* Search

Same idea, use  $g(s) + h(s)$ , with one requirement

- Demand that  $h(s) \leq h^*(s)$  ← Optimal cost to goal
- If heuristic has this property, “admissible”
  - Optimistic! Never over-estimates
- Still need  $h(s) \geq 0$ 
  - Negative heuristics can lead to strange behavior
- This is **A\*** search

# Attempt 3: A\* Search

## Origins: robots and planning

Shakey the Robot,  
1960's

Credit: Wiki

**Animation:** finding a path  
around obstacle

Credit: Wiki

# Admissible Heuristic Functions

Have to be careful to ensure admissibility (**optimism!**)

- Example: **8 Game**

Example State	1		5
	2	6	3
	7	4	8

Goal State	1	2	3
	4	5	6
	7	8	

- One useful approach: **relax constraints**
  - $h(s)$  = number of tiles in wrong position
    - allows tiles to fly to destination in a single step

# Break & Quiz

**Q 1.1:** Consider finding the fastest driving route from one US city to another. Measure cost as the number of hours driven when driving at the speed limit. Let  $h(s)$  be the number of hours needed to ride a bike from city  $s$  to your destination.  $h(s)$  is

- A. An admissible heuristic
- B. Not an admissible heuristic

# Break & Quiz

**Q 1.1:** Consider finding the fastest driving route from one US city to another. Measure cost as the number of hours driven when driving at the speed limit. Let  $h(s)$  be the number of hours needed to ride a bike from city  $s$  to your destination.  $h(s)$  is

- A. An admissible heuristic
- **B. Not an admissible heuristic**

# Break & Quiz

**Q 1.1:** Consider finding the fastest driving route from one US city to another. Measure cost as the number of hours driven when driving at the speed limit. Let  $h(s)$  be the number of hours needed to ride a bike from city  $s$  to your destination.  $h(s)$  is

- A. An admissible heuristic **No: riding your bike takes longer.**
- **B. Not an admissible heuristic**

# Break & Quiz

**Q 1.2:** Which of the following are admissible heuristics?

(i)  $h(s) = h^*(s)$

(ii)  $h(s) = \max(2, h^*(s))$

(iii)  $h(s) = \min(2, h^*(s))$

(iv)  $h(s) = h^*(s) - 2$

(v)  $h(s) = \text{sqrt}(h^*(s))$

- A. All of the below
- B. (i), (iii), (iv)
- C. (i), (iii)
- D. (i), (iii), (v)

# Break & Quiz

**Q 1.2:** Which of the following are admissible heuristics?

(i)  $h(s) = h^*(s)$

(ii)  $h(s) = \max(2, h^*(s))$

(iii)  $h(s) = \min(2, h^*(s))$

(iv)  $h(s) = h^*(s) - 2$

(v)  $h(s) = \text{sqrt}(h^*(s))$

- A. All of the below
- B. (i), (iii), (iv)
- **C. (i), (iii)**
- D. (i), (iii), (v)

# Break & Quiz

**Q 1.2:** Which of the following are admissible heuristics?

(i)  $h(s) = h^*(s)$

(ii)  $h(s) = \max(2, h^*(s))$       No:  $h(s)$  might be too big

(iii)  $h(s) = \min(2, h^*(s))$

(iv)  $h(s) = h^*(s) - 2$       No:  $h(s)$  might be negative

(v)  $h(s) = \text{sqrt}(h^*(s))$       No: if  $h^*(s) < 1$  then  $h(s)$  is bigger

- A. All of the below
- B. (i), (iii), (iv)
- **C. (i), (iii)**
- D. (i), (iii), (v)

# Heuristic Function Tradeoffs

Dominance:  $h_2$  dominates  $h_1$  if for all states  $s$ ,

$$h_1(s) \leq h_2(s) \leq h^*(s)$$

- **Idea:** we want to be as close to  $h^*$  as possible
  - But not over!
- **Tradeoff:** being very close might require a very complex heuristic, expensive computation
  - Might be better off with cheaper heuristic & expand more nodes.

# A\* Termination

When should A\* **stop**?

- One idea: as soon as we reach goal state?

- ***h*** admissible, but note that we get  $A \rightarrow B \rightarrow G$  (**cost 1000**)!

# A\* Termination

When should A\* stop?

- **Rule:** terminate **when a goal is popped** from queue.

- Note: taking  $h = 0$  reduces to uniform cost search rule.

# A\* Revisiting Expanded States

Possible to revisit an expanded state, get a shorter path:

Fringe	$g(s) + h(s)$
A	0+1
B,C	1+1, 1+900
C,D	1+900, 3+1
C,G	1+900, 1002+0
D,G	2+1, 1002+0
G	1001+0

A -> C -> G

- Put D back into priority queue, smaller  $g+h$

# A\* Full Algorithm

1. Put the start node  $S$  on the priority queue, called  $OPEN$
2. If  $OPEN$  is empty, exit with failure
3. Remove from  $OPEN$  and place on  $CLOSED$  a node  $n$  for which  $f(n)$  is minimum (note that  $f(n)=g(n)+h(n)$ )
4. If  $n$  is a goal node, exit (trace back pointers from  $n$  to  $S$ )
5. Expand  $n$ , generating all successors and attach to pointers back to  $n$ . For each successor  $n'$  of  $n$ 
  1. If  $n'$  is not already on  $OPEN$  or  $CLOSED$  estimate  $h(n')$ ,  $g(n')=g(n)+c(n,n')$ ,  $f(n')=g(n')+h(n')$ , and place it on  $OPEN$ .
  2. If  $n'$  is already on  $OPEN$  or  $CLOSED$ , then check if  $g(n')$  is lower for the new version of  $n'$ . If so, then:
    1. Redirect pointers backward from  $n'$  along path yielding lower  $g(n')$ .
    2. Put  $n'$  on  $OPEN$ .
  3. If  $g(n')$  is not lower for the new version, do nothing.
6. Go to 2.

# A\* Analysis

Some properties:

- Terminates!
- A\* can use **lots of memory**:  $O(\# \text{ states})$ .
- Will run out on large problems.
- Next, we will consider some alternatives to deal with this.

# Break & Quiz

**Q 2.1:** Consider two heuristics for the 8 puzzle problem.  $h_1$  is the number of tiles in wrong position.  $h_2$  is the  $l_1$ /Manhattan distance between the tiles and the goal location. How do  $h_1$  and  $h_2$  relate?

- A.  $h_2$  dominates  $h_1$
- B.  $h_1$  dominates  $h_2$
- C. Neither dominates the other

Example  
State

1		5
2	6	3
7	4	8

# Break & Quiz

**Q 2.1:** Consider two heuristics for the 8 puzzle problem.  $h_1$  is the number of tiles in wrong position.  $h_2$  is the  $l_1$ /Manhattan distance between the tiles and the goal location. How do  $h_1$  and  $h_2$  relate?

- A.  $h_2$  dominates  $h_1$
- B.  $h_1$  dominates  $h_2$
- C. Neither dominates the other

Example  
State

1		5
2	6	3
7	4	8

# Break & Quiz

**Q 2.1:** Consider two heuristics for the 8 puzzle problem.  $h_1$  is the number of tiles in wrong position.  $h_2$  is the  $l_1$ /Manhattan distance between the tiles and the goal location. How do  $h_1$  and  $h_2$  relate?

Example  
State

1		5
2	6	3
7	4	8

- **A.  $h_2$  dominates  $h_1$**
- **B.  $h_1$  dominates  $h_2$  (No:  $h_1$  is a distance where each entry is at most 1,  $h_2$  can be greater)**
- **C. Neither dominates the other**

# Break & Quiz

**Q 2.2:** Consider the state space graph below. Goal states have bold borders.  $h(s)$  is show next to each node. What node will be expanded by A\* after the initial state I?

- A.
- B.
- C.

# Break & Quiz

**Q 2.2:** Consider the state space graph below. Goal states have bold borders.  $h(s)$  is show next to each node. What node will be expanded by A\* after the initial state I?

- **A.**
- B.
- C.

# IDA\*: Iterative Deepening A\*

Similar idea to our earlier iterative deepening.

- Bound the memory in search.
- At each phase, don't expand any node with  $g(s) + h(s) > k$ ,
  - Assuming integer costs, do this for  $k=0$ , then  $k=1$ , then  $k=2$ , and so on
- Complete + optimal, might be costly time-wise
  - Revisit many nodes
- Lower memory use than A\*

# IDA\*: Properties

How many restarts do we expect?

- With integer costs, optimal solution  $C^*$ , at most  $C^*$

What about non-integer costs?

- Initial threshold  $k$ . Use the same rule for non-expansion
- Set new  $k$  to be the min  $g(s) + h(s)$  for non-expanded nodes
- Worst case: restarted for each state

# Beam Search

General approach (beyond A\* too)

- Priority queue with fixed size  $k$ ; beyond  $k$  nodes, **discard!**
- **Upside**: good memory efficiency
- **Downside**: not complete or optimal

Variation:

- Priority queue with nodes that **are at most  $\epsilon$  worse** than best node.

# Summary

- Informed search: introduce heuristics
  - Not all approaches work: best-first greedy is bad
- A\* algorithm
  - Properties of A\*, idea of admissible heuristics
- Beyond A\*
  - IDA\*, beam search. Ways to deal with space requirements.
