## CS 540 Introduction to Artificial Intelligence Classification - KNN and Naive Bayes

University of Wisconsin-Madison Spring 2023

## Announcements

- Homeworks:
- HW5 due Thursday.
- Class roadmap:

| Tuesday, Feb 28 | ML: K - Nearest Neighbors <br> \& Naive Bayes |
| :--- | :--- |
| Thursday, Mar 2 | ML: Neural Networks I |
| Tuesday, Mar 7 | ML: Neural Networks <br> II |
| Thursday, Mar 9 | Review Lecture; <br> Midterm 5:45-7:15pm |

## Today's outline

- The K-Nearest Neighbors for supervised learning.
- Maximum likelihood estimation (MLE) and classification with MLE.
- Naive Bayes Classifiers

## Part I: K-nearest neighbors

The Free Encyclopedia

Main page

Article Talk

## $k$-nearest neighbors algorithm

From Wikipedia, the free encyclopedia

Not to be confused with k-means clustering.

## Example 1: Predict whether a user likes a song or not

## Example 1: Predict whether a user likes a song or not

Example 1: Predict whether a user likes a song or not $1-N N$

- DisLike
- Like

Example 1: Predict whether a user likes a song or not $1-N N$

- DisLike
- Like

## K-nearest neighbors for classification

- Input: Training data $\left(\mathbf{x}_{1}, y_{1}\right),\left(\mathbf{x}_{2}, y_{2}\right), \ldots,\left(\mathbf{x}_{n}, y_{n}\right)$

Distance function $d\left(\mathbf{x}_{i}, \mathbf{x}_{j}\right)$; number of neighbors $k$; test data $\mathbf{x}^{*}$

1. Find the $k$ training instances $\mathbf{x}_{i_{1}}, \ldots, \mathbf{x}_{i_{k}}$ closest to $\mathbf{x}^{*}$ under $d\left(\mathbf{x}_{i}, \mathbf{x}_{j}\right)$
2. Output $y^{*}$ as the majority class of $y_{i_{1}}, \ldots, y_{i_{k}}$. Break ties randomly.

## Example 2: 1-NN for little green man

- Predict gender (M,F) from weight, height

- Predict age (adult, juvenile) from weight, height

(a) classification by gender

Decision boundary

(b) classification by age

## The decision regions for 1-NN

Voronoi diagram: each polyhedron indicates the region of feature space that is in the nearest neighborhood of each training instance

## K-NN for regression

- What if we want regression?
- Instead of majority vote, take average of neighbors' labels
- Given test point $\mathbf{x}^{*}$, find its $k$ nearest neighbors $\mathbf{x}_{i_{1}}, \ldots, \mathbf{x}_{i_{k}}$
- Output the predicted label $\frac{1}{k}\left(y_{i_{1}}+\ldots+y_{i_{k}}\right)$

## What distance function to use?

- K-nearest neighbors requires a distance function to determine nearest neighbors. How to define this?
- All features take on discrete values.
- Use Hamming distance: count the number of features in which the features values differ.
- All features take on continuous values.
- Euclidean Distance: sum of squares:
- $d(p, q)=\sqrt{\sum_{i=1}^{d}\left(p_{i}-q_{i}\right)^{2}}$
- Manhattan Distance:
- $d(p, q)=\sum_{i=1}^{d}\left|p_{i}-q_{i}\right|$

## What distance function to use?

- Be careful with scale
- Same feature but different units may change relative distance (fixing other features)
- Sometimes OK to normalize each feature dimension (z-score)

$$
x_{i d}^{\prime}=\frac{x_{i d}-\mu_{d}}{\sigma_{d}}, \forall i=1 \ldots n, \forall d
$$

- Other times not OK: e.g. dimension contains small random noise

## Effect of $k$

## How to pick the number of neighbors

- Split data into training and tuning sets
- Classify tuning set with different k
- Pick k that produces least tuning-set error
(Shuffle whole dataset first)

| $\left(x_{1}, y_{1}\right)$ | $\cdots$ | $\left(x_{n}, y_{n}\right)$ | $\cdots$ | $\left(x_{N}, y_{N}\right)$ |
| :---: | :---: | :---: | :---: | :---: |

## Quiz break

Q1-1: K-NN algorithms can be used for:

- A Only classification
- B Only regression
- C Both

## Quiz break

## Q1-1: K-NN algorithms can be used for:

- A Only classification
- B Only regression
- C Both

## Quiz break

Q1-2: Which of the following distance measure do we use in case of categorical (discrete) variables in k-NN?

- A Hamming distance
- B Euclidean distance
- C Manhattan distance

## Quiz break

Q1-2: Which of the following distance measure do we use in case of categorical (discrete) variables in k-NN?

- A Hamming distance
- B Euclidean distance
- C Manhattan distance

## Quiz break

Q1-3: Consider binary classification in 2D where the intended label of a point $x=(x 1, x 2)$ is positive if $x 1>x 2$ and negative otherwise. Let the training set be all points of the form $\mathrm{x}=[4 \mathrm{a}$, 3b] where a,b are integers. Each training item has the correct label that follows the rule above. With a 1 NN classifier (Euclidean distance), which ones of the following points are labeled positive? Multiple answers.

- [5.52, 2.41]
- [8.47, 5.84]
- [7,8.17]
- [6.7,8.88]

Let the training set be all points of the form $\mathrm{x}=[4 \mathrm{a}$, 3b] where a,b are integers. Each training item has the correct label that follows the rule above. With a 1 NN classifier (Euclidean distance), which ones of the following points are labeled positive? Multiple answers.

- [5.52, 2.41]
- [8.47, 5.84]
- [7,8.17]
- [6.7,8.88]

Nearest neighbors are
$[4,3]$ => positive
$[8,6]$ => positive
$[8,9] \quad=>$ negative
[8,9] $=>$ negative
Individually.

## Part II: Maximum Likelihood Estimation

## Supervised Machine Learning

## Supervised Machine Learning

Statistical modeling approach

## Labeled training data ( n examples)

$$
\left(\mathbf{x}_{1}, y_{1}\right),\left(\mathbf{x}_{2}, y_{2}\right), \ldots,\left(\mathbf{x}_{n}, y_{n}\right)
$$

drawn independently from
a fixed underlying distribution
(also called the i.i.d. assumption)

## Supervised Machine Learning

Statistical modeling approach

| Labeled training |
| :---: |
| data ( $n$ examples) |

Classifier $\hat{f}$
$\left(\mathbf{x}_{1}, y_{1}\right),\left(\mathbf{x}_{2}, y_{2}\right), \ldots,\left(\mathbf{x}_{n}, y_{n}\right)$
drawn independently from
a fixed underlying distribution
(also called the i.i.d. assumption)
select $\hat{f}(\theta)$ from a pool of models $\mathscr{F}$ that best describe the data observed

## How to select $\hat{f} \in \mathscr{F}$ ?

- Maximum likelihood (best fits the data)
- Maximum a posteriori (best fits the data but incorporates prior assumptions)
- Optimization of 'loss' criterion (best discriminates the labels)

## Maximum Likelihood Estimation: An Example

 Flip a coin 10 times, how can you estimate $\theta=p(\mathrm{Head})$ ?

Intuitively, $\theta=4 / 10=0.4$

## How good is $\theta$ ?

It depends on how likely it is to generate the observed data $\mathbf{x}_{1}, \mathbf{x}_{2}, \ldots, \mathbf{x}_{n} \quad$ (Let's forget about labels for a second)

Likelihood function $L(\theta)=\prod_{i} p\left(\mathbf{x}_{i} \mid \theta\right)$

Under i.i.d assumption
Interpretation: How probable (or how likely) is the data given the probabilistic model $p_{\theta}$ ?

## How good is $\theta$ ?

It depends on how likely it is to generate the observed data $\mathbf{x}_{1}, \mathbf{x}_{2}, \ldots, \mathbf{x}_{n} \quad$ (Let's forget about label for a second) Likelihood function $L(\theta)=\prod_{i} p\left(\mathbf{x}_{i} \mid \theta\right)$

Bernoulli distribution

## Log-likelihood function

$$
\begin{aligned}
& L(\theta)=\theta \cdot(1-\theta) \cdot(1-\theta) \cdot \theta \cdot \theta \\
& \quad=\theta^{N_{H}} \cdot(1-\theta)^{N_{T}}
\end{aligned}
$$

Log-likelihood function

# $N_{H}, N_{T}$ is number of heads, tails 

 respectively.$$
\begin{aligned}
\ell(\theta) & =\log L(\theta) \\
& =N_{H} \log \theta+N_{T} \log (1-\theta)
\end{aligned}
$$

## Maximum Likelihood Estimation (MLE)

Find optimal $\theta^{*}$ to maximize the likelihood function (and log-likelihood)

$$
\begin{gathered}
\theta^{*}=\operatorname{argmax} N_{H} \log \theta+N_{T} \log (1-\theta) \\
\frac{\partial l(\theta)}{\partial \theta}=\frac{N_{H}}{\theta}-\frac{N_{T}}{1-\theta}=0 \longmapsto \theta^{*}=\frac{N_{H}}{N_{T}+N_{H}}
\end{gathered}
$$

which confirms your intuition for estimating $p($ Head )!

## Maximum Likelihood Estimation: Gaussian Model

Fitting a model to heights of females
Observed some data (in inches): $60,62,53,58, \ldots \in \mathbb{R}$

$$
\left\{x_{1}, x_{2}, \ldots, x_{n}\right\}
$$

Model class: Gaussian model

$$
p(x)=\frac{1}{\sqrt{2 \pi \sigma^{2}}} \exp \left(-\frac{(x-\mu)^{2}}{2 \sigma^{2}}\right)
$$

So, what's the MLE for the given data?

## Estimating the parameters in a Gaussian

- Mean

$$
\mu=\mathbb{E}[x] \text { hence } \hat{\mu}=\frac{1}{n} \sum_{i=1}^{n} x_{i}
$$

- Variance

$$
\sigma^{2}=\mathbb{E}\left[(x-\mu)^{2}\right] \text { hence } \hat{\sigma}^{2}=\frac{1}{n} \sum_{i=1}^{n}\left(x_{i}-\hat{\mu}\right)^{2}
$$

## Maximum Likelihood Estimation: Gaussian Model

Observe some data (in inches): $x_{1}, x_{2}, \ldots, x_{n} \in \mathbb{R}$
Assume that the data is drawn from a Gaussian

$$
L\left(\mu, \sigma^{2} \mid X\right)=\prod_{i=1}^{n} p\left(x_{i} ; \mu, \sigma^{2}\right)=\prod_{i=1}^{n} \frac{1}{2 \pi \sigma^{2}} \exp \left(-\frac{\left(x_{i}-\mu\right)^{2}}{2 \sigma^{2}}\right)
$$

Fitting parameters is maximizing likelihood w.r.t $\mu, \sigma^{2}$ (maximize likelihood that data was generated by model)

MLE

$$
\underset{\mu, \sigma^{2}}{\arg \max _{i=1}} \prod_{i}^{n} p\left(x_{i} ; \mu, \sigma^{2}\right)
$$

## Maximum Likelihood

- Estimate parameters by finding ones that explain the data

$$
\underset{\mu, \sigma^{2}}{\operatorname{argmax}} \prod_{i=1}^{n} p\left(x_{i} ; \mu, \sigma^{2}\right)=\underset{\mu, \sigma^{2}}{\operatorname{argmin}}-\log \prod_{i=1}^{n} p\left(x_{i} ; \mu, \sigma^{2}\right)
$$

- Decompose likelihood

$$
\sum_{i=1}^{n} \frac{1}{2} \log \left(2 \pi \sigma^{2}\right)+\frac{1}{2 \sigma^{2}}\left(x_{i}-\mu\right)^{2}=\frac{n}{2} \log \left(2 \pi \sigma^{2}\right)+\frac{1}{2 \sigma^{2}} \sum_{i=1}^{n}\left(x_{i}-\mu\right)^{2}
$$

$$
\text { Minimized for } \mu=\frac{1}{n} \sum_{i=1}^{n} x_{i}
$$

## Maximum Likelihood

- Estimating the variance

$$
\frac{n}{2} \log \left(2 \pi \sigma^{2}\right)+\frac{1}{2 \sigma^{2}} \sum_{i=1}^{n}\left(x_{i}-\mu\right)^{2}
$$

## Maximum Likelihood

- Estimating the variance

$$
\frac{n}{2} \log \left(2 \pi \sigma^{2}\right)+\frac{1}{2 \sigma^{2}} \sum_{i=1}^{n}\left(x_{i}-\mu\right)^{2}
$$

- Take derivatives with respect to it

$$
\begin{aligned}
& \partial_{\sigma^{2}}[\cdot]=\frac{n}{2 \sigma^{2}}-\frac{1}{2 \sigma^{4}} \sum_{i=1}^{n}\left(x_{i}-\mu\right)^{2}=0 \\
& \Longrightarrow \sigma^{2}=\frac{1}{n} \sum_{i=1}^{n}\left(x_{i}-\mu\right)^{2}
\end{aligned}
$$

## How do we use MLE for classification?

## Classification via Bayes Rule

$$
\hat{y}=\hat{f}(\mathbf{x})=\arg \max p(y \mid \mathbf{x}) \quad \text { (Posterior) }
$$

(Prediction)

## Classification via Bayes Rule

$$
\hat{y}=\hat{f}(\mathbf{x})=\arg \max p(y \mid \mathbf{x})
$$

(Prediction)

$$
\begin{aligned}
& =\underset{y}{\arg \max } \frac{p(\mathbf{x} \mid y) \cdot p(y)}{p(\mathbf{x})} \quad \text { (by Bayes' rule) } \\
& =\underset{y}{\arg \max } p(\mathbf{x} \mid y) p(y)
\end{aligned}
$$

Using labelled training data, learn class priors and class conditionals

## Quiz break

## Q2-2: True or False

Maximum likelihood estimation is the same regardless of whether we maximize the likelihood or log-likelihood function.

- A True
- B False

## Quiz break

## Q2-2: True or False

Maximum likelihood estimation is the same regardless of whether we maximize the likelihood or log-likelihood function.

- A True
- B False

- C 152.2
- D 162.2

## Part III: Naïve Bayes

## Example 1: Play outside or not?

- If weather is sunny, would you likely to play outside?

Posterior probability $\mathrm{p}\left(\mathrm{Yes} \left\lvert\, \begin{array}{l}\text { 先 }\end{array}\right.\right)$ vs. p (No|

## Example 1: Play outside or not?

- If weather is sunny, would you likely to play outside?

Posterior probability $\mathrm{p}(\mathrm{Yes} \mid$

- Weather = \{Sunny, Rainy, Overcast $\}$
- Play $=\{$ Yes, No $\}$
- Observed data $\{$ Weather, play on day $m\}, m=\{1,2, \ldots, N\}$

## Example 1: Play outside or not?

- If weather is sunny, would you likely to play outside?

Posterior probability $p(\mathrm{Yes} \mid$

- Weather = \{Sunny, Rainy, Overcast $\}$
- Play $=\{$ Yes, No $\}$
- Observed data $\{$ Weather, play on day $m\}, m=\{1,2, \ldots, N\}$

## Example 1: Play outside or not?

- Step 1: Convert the data to a frequency table of Weather and Play

| Weather | Play |
| :--- | :--- |
| Sunny | No |
| Overcast | Yes |
| Rainy | Yes |
| Sunny | Yes |
| Sunny | Yes |
| Overcast | Yes |
| Rainy | No |
| Rainy | No |
| Sunny | Yes |
| Rainy | Yes |
| Sunny | No |
| Overcast | Yes |
| Overcast | Yes |
| Rainy | No |

| Frequency Table |  |  |
| :--- | :---: | :---: |
| Weather | No | Yes |
| Overcast |  | 4 |
| Rainy | 3 | 2 |
| Sunny | 2 | 3 |
| Grand Total | 5 | 9 |

## Example 1: Play outside or not?

Step 1: Convert the data to a frequency table of Weather and Play
Step 2: Based on the frequency table, calculate likelihoods and priors

| Weather | Play |
| :--- | :--- |
| Sunny | No |
| Overcast | Yes |
| Rainy | Yes |
| Sunny | Yes |
| Sunny | Yes |
| Overcast | Yes |
| Rainy | No |
| Rainy | No |
| Sunny | Yes |
| Rainy | Yes |
| Sunny | No |
| Overcast | Yes |
| Overcast | Yes |
| Rainy | No |

| Frequency Table |  |  |
| :--- | :---: | :---: |
| Weather | No | Yes |
| Overcast |  | 4 |
| Rainy | 3 | 2 |
| Sunny | 2 | 3 |
| Grand Total | 5 | 9 |

| Likelihood table |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
| \begin{tabular}{\|l|c|c|}
\hline
\end{tabular} |  |  |  |  |
| Weather | No | Yes |  |  |
| Overcast |  | 4 | $=4 / 14$ | 0.29 |
| Rainy | 3 | 2 | $=5 / 14$ | 0.36 |
| Sunny | 2 | 3 | $=5 / 14$ | 0.36 |
| All | 5 | 9 |  |  |

$$
\begin{aligned}
& \text { p(Play = Yes) }=0.64 \\
& \text { p(婇 } 1 \text { Yes) }=3 / 9=0.33
\end{aligned}
$$

## Example 1: Play outside or not?

Step 3: Based on the likelihoods and priors, calculate posteriors
P(Yes|演)

$$
=P\left({ }^{\prime}\right.
$$

?

P(Nol
?

## Example 1：Play outside or not？

Step 3：Based on the likelihoods and priors，calculate posteriors

```
P(Yes| 沙)
    =P(棌 |Yes)*P(Yes)/P(棌)
    =0.33*0.64/0.36
    =0.6
P(No| 嫁)
    =P(渞 |No)*P(No)/P(乷)
    =0.4*0.36/0.36
    =0.4
```

## Bayesian classification

$$
\hat{y}=\arg \max p(y \mid \mathbf{x}) \quad \text { (Posterior) }
$$

(Prediction)

$$
\begin{aligned}
& =\arg \max \frac{p(\mathbf{x} \mid y) \cdot p(y)}{p(\mathbf{x})} \quad \text { (by Bayes' rule) } \\
& =\arg \max p(\mathbf{x} \mid y) p(y)
\end{aligned}
$$

## Bayesian classification

What if $\mathbf{x}$ has multiple attributes $\mathbf{x}=\left\{X_{1}, \ldots, X_{k}\right\}$

$$
\hat{y}=\arg \max p\left(y \mid X_{1}, \ldots, X_{k}\right) \quad \text { (Posterior) }
$$

(Prediction)

## Bayesian classification

What if $\mathbf{x}$ has multiple attributes $\mathbf{x}=\left\{X_{1}, \ldots, X_{k}\right\}$

$$
\underset{\text { (Prediction) }}{\hat{y}=\arg \max } p\left(y \mid X_{1}, \ldots, X_{k}\right) \quad \text { (Posterior) }
$$

$$
=\arg \max \frac{p\left(X_{1}, \ldots, X_{k} \mid y\right) \cdot p(y)}{n(X} \quad \text { (by Bayes' rule) }
$$

## Bayesian classification

What if $\mathbf{x}$ has multiple attributes $\mathbf{x}=\left\{X_{1}, \ldots, X_{k}\right\}$

$$
\hat{y}=\arg \max p\left(y \mid X_{1}, \ldots, X_{k}\right) \quad \text { (Posterior) }
$$

(Prediction)

$$
\begin{aligned}
& =\arg \max _{y} \frac{p\left(X_{1}, \ldots, X_{k} \mid y\right) \cdot p(y)}{p\left(X_{1}, \ldots, X_{k}\right)} \quad \text { (by Bayes' rule) } \\
& =\arg \max _{y} \operatorname{p(X_{1},\ldots ,X_{k}|y)p(y)} \\
& \quad \begin{array}{l}
\text { Class conditional Class prior } \\
\text { likelihood }
\end{array}
\end{aligned}
$$

## Naïve Bayes Assumption

Conditional independence of feature attributes

$$
p\left(X_{1}, \ldots, X_{k} \mid y\right) p(y)=\prod_{i=1}^{k} p\left(X_{i} \mid y\right) p(y)
$$

Easier to estimate
(using MLE!)

## Quiz break

Q3-1: Which of the following about Naive Bayes is incorrect?

- A Attributes can be nominal or numeric
- B Attributes are equally important
- C Attributes are statistically dependent of one another given the class value
- D Attributes are statistically independent of one another given the class value
- E All of above
