# Language Development Metrics

◆ MLU ● Mean D-Level

● MLU (Mean Length of Utterance) [Brown '73]

● Parse depth [Yngve, '60]

● D-Level [Rosenberg et al., '87; Covington et al., '06]  
[Lu, '09]

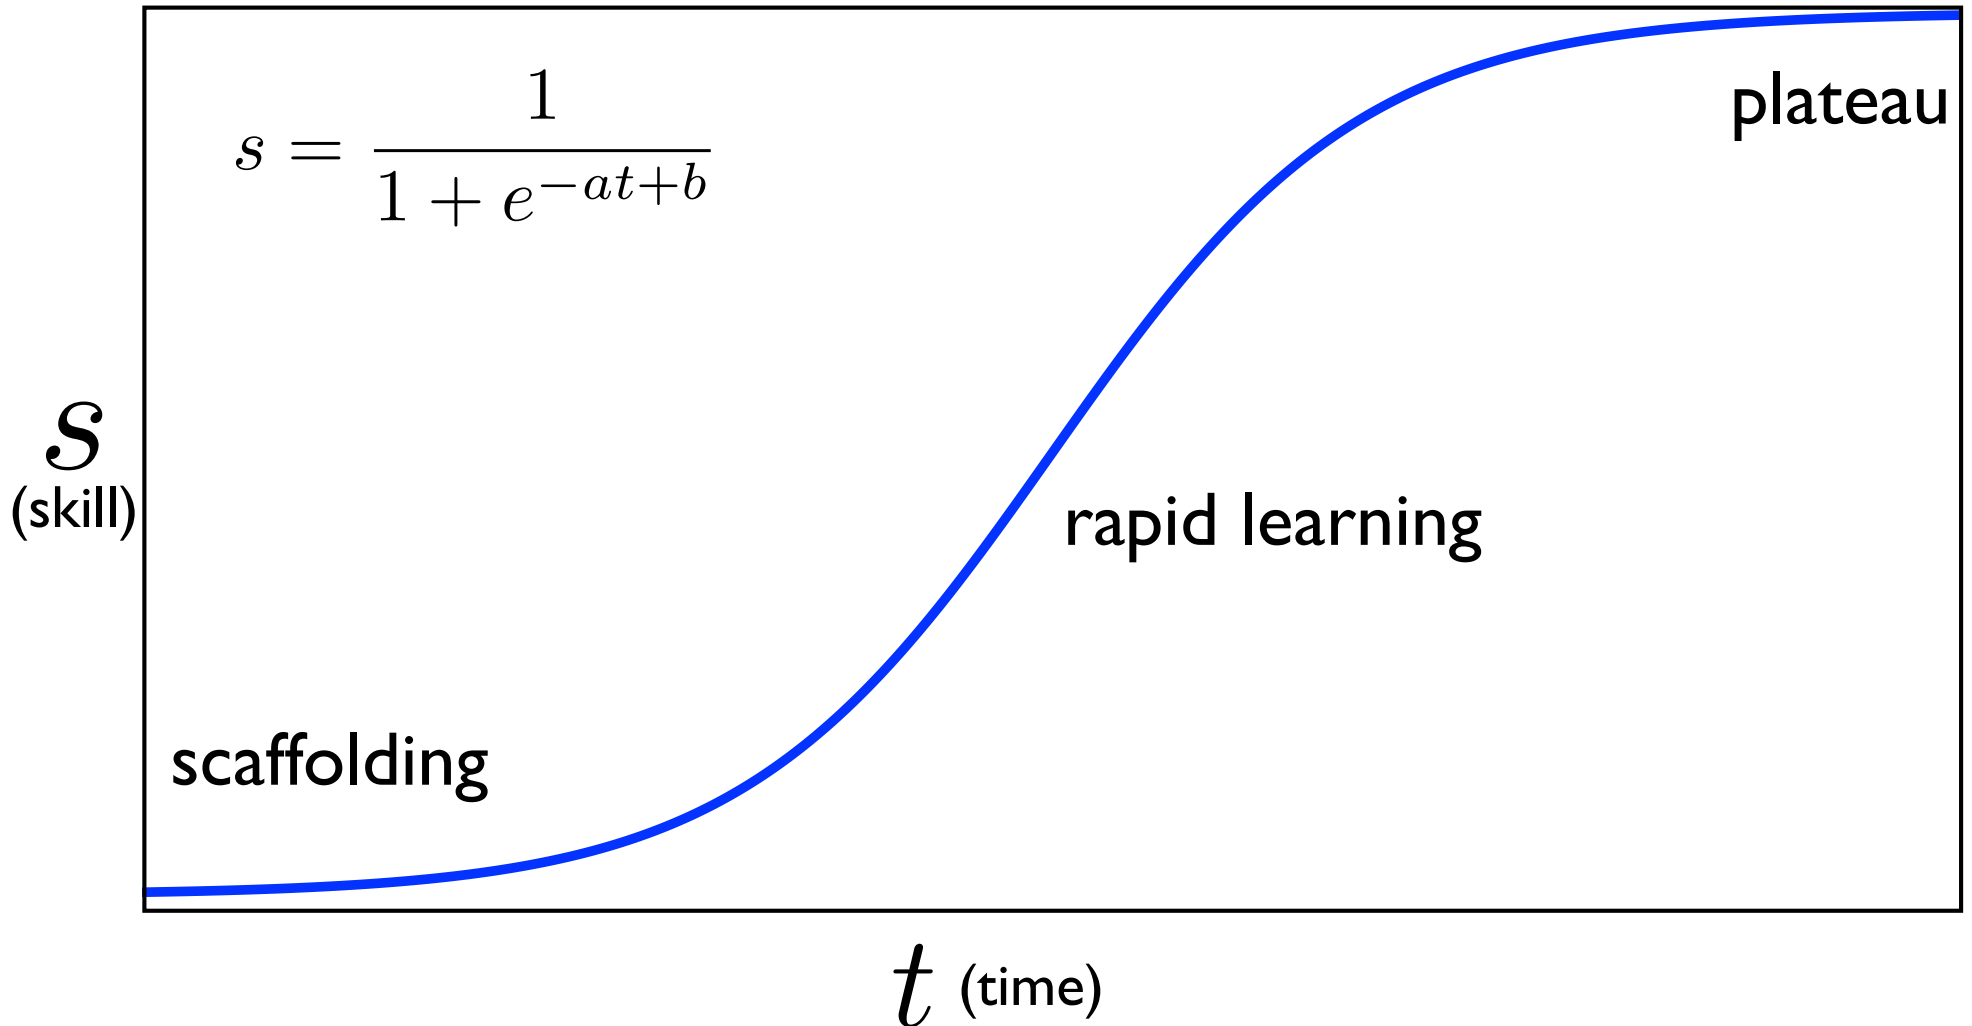

● IPSYN [Scarborough, 1990] [Sagae, '05]

# Language Development Metrics

- Drawbacks of previous metrics:
  - ~ Coarse and ad-hoc
  - ~ Questionable validity
  - ~ Accuracy degrades with age

**Question 1: Can we induce a more accurate metric using statistical learning methods?**

# Skill as function of time

- Skill acquisition follows sigmoidal curve [Hodgetts '91]

# Time as Ground Truth

$$s \approx \beta \cdot \mathbf{x}$$

skill      parameters      features

$$t = \frac{b - \ln\left(\frac{1}{s} - 1\right)}{a}$$

- Invert sigmoid
- Skill as combination of features
- Evaluate learned metric via age prediction error

# Age Prediction Model

$$t = a(\beta \cdot \mathbf{x}) + b$$

- Age window at linear part of sigmoid
- Predict age as linear function of skill

# Features

- Pre-defined metrics:

- ~ MLU

- ~ Parse Depth

- ~ D-Level

- Novel features

- ~ Preposition counts

- ~ “Be” verb counts

- ~ Article counts

- ~ Word frequency

- ~ Function to content word ratio

# Data

- Child speech from transcribed conversations in CHILDES database [MacWhinney, '00]
- Longitudinal studies of 7 children

- Learn via linear regression -- Separately for each child.

# Results

(lower is better)

	<b>D-Level</b>	<b>Depth</b>	<b>MLU</b>	<b>All Features</b>
<b>Mean</b>	63.795	66.327	64.578	<b>54.041</b>

Mean squared error of age prediction in months

# Results

(lower is better)

	<b>D-Level</b>	<b>Depth</b>	<b>MLU</b>	<b>All Features</b>
<b>Adam</b>	14.037	14.149	<b>11.128</b>	14.175
<b>Abe</b>	34.69	44.701	<b>34.509</b>	39.931
<b>Ross</b>	329.64	336.612	345.046	<b>244.071</b>
<b>Peter</b>	23.58	13.045	<b>8.245</b>	24.128
<b>Naomi</b>	<b>24.458</b>	28.426	34.956	45.036
<b>Sarah</b>	12.503	20.878	13.905	<b>6.989</b>
<b>Nina</b>	7.654	6.477	4.255	<b>3.96</b>
<b>Mean</b>	63.795	66.327	64.578	<b>54.041</b>

Mean squared error of age prediction in months

# Results

(lower is better)

	<b>D-Level</b>	<b>Depth</b>	<b>MLU</b>	<b>All Features</b>
<b>Adam</b>	14.037	14.149	<b>11.128</b>	14.175

Mean squared error of age prediction in months

## **Question 2: Can we learn a metric that generalizes across children?**

- Task: Train on a set of children, evaluate on a held-out child.
- Children learn at different rates, so must predict relative mastery, not absolute age.

# Ordering Model

$$y = \sum_i \beta_i \mathbf{x}_i + \sum_{i,j} \gamma_{ij} \mathbf{x}_i \mathbf{x}_j$$

Score used for ranking

Sum over features

Sum over feature pairs

- Each iteration trains on 6 children, tests on held-out child
- Score each sample as weighted combination of features and feature pairs
- Rank speech samples in order of ascending score

# Evaluation: Kendall's $\tau$

$$\tau = \frac{(\text{num. concordant pairs}) - (\text{num. discordant pairs})}{\frac{1}{2}n(n-1)}$$

- Kendall's rank correlation coefficient
  - ~ Measures similarity between 2 orderings over a set
  - ~ Identical orderings yield +1, independent orderings yield 0

# Parameter Estimation

$$(\beta^*, \gamma^*) = \operatorname{argmax}_{\beta, \gamma} \sum_{k \in kids} \tau(k, \beta, \gamma)$$

- $\tau(k, \beta, \gamma) \equiv$  Kendall  $\tau$  between model ordering and true chronological order for child  $k$ .
- Find best parameters via Nelder-Mead [Nelder and Mead, '65]
  - ~ Gradient-free hill climbing search that shifts parameter values until reaching a local optimum.

# Results

(higher is better)

MLU	All Features	MLU & Fn. / Content
0.7456	0.7457	<b>0.7780</b>

Average Kendall  $\tau$  of model orderings versus true chronological orderings.

# Contributions

- New method of inducing language development metrics
- Methodology for validating these metrics
- Increased performance over hand-crafted baseline metrics
