Lecture 14

- Next Wednesday is the last lecture.
- Short lecture: more debug examples, other features of MATLAB.
- Message me on Piazza if you would like me to cover anything specific.

Bisection Method

Newton's Method

Secant Method

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

- P7 due next week, solution already posted.
- P1 to P7 and Q1 to Q15 grades will be updated tonight.
- Late code submissions for P1 to P6 will be accepted.
- Grades need to be submitted to department by May 16 so May 15 is the absolute latest day to make any submission and message me about your grade.

Algebraic Equations

 An algebraic equation, also called a polynomial equation, are ones in the form,

$$\sum_{i=0}^{n} a_i x^i = 0.$$

- Root finding is the process of numerically finding one or all x's that satisfy the above equation.
- There are in general *n* solutions or roots (possibly complex or repeated) to the above equation.

Non-linear Equations Math

- In general, non-linear equations in the form f (x) = 0 are solved using iterative methods.
- Start with a random guess x_0 , and compute a sequence $x_1, x_2, ...$ with the property that $x^* = \lim_{n \to \infty} x_i$ satisfies $f(x^*) = 0$.

Bisection Method

Newton's Method

Secant Method

Intermediate Value Theorem

- Intermediate Value Theorem says given a continuous function f, for any u between f (a) and f (b), there exists an x ∈ [a, b] such that f (x) = u.
- IVT implies that if $f(a) \ge 0$ and $f(b) \le 0$, then there exists an $x \in [a, b]$ such that f(x) = 0.
- Bisection method uses this observation to iteratively reduce the interval [a, b] that contains the root by a half until a and b are close enough.

Bisection Method Step 1

•
$$f(-1) = -1, f(0) = 1, f(1) = 3, f(x) = 0$$
, then,

- *A* : *x* must be in [-1, 0]
- *B* : *x* must be in [0, 1]
- C : x could be in [-1,0]
- *D* : *x* could be in [0,1]

Search Math

 Bisection method can be used to find a root of f (x) = 0 in an interval x ∈ [x₀, x₁].

• Start with
$$[x_0, x_1]$$
 and $x = \frac{1}{2}(x_0 + x_1)$.

- If f (x) and f (x₀) has different signs, the solution is between x₀ and x, use bisection method on [x₀, x].
- If f (x) and f (x₁) has different signs, the solution is between x and x₁, use bisection method on [x, x₁].
- Stop when f(x) = 0 or x_0 and x_1 are close enough.

Newton's Method Step

- f(0) = 1, f'(0) = -1, there is a unique x such that f(x) = 0, then
- A : x must be less than 0
- B : x must be more than 0
- C : x could be less than 0
- D : x could be more than 0

Bisection Method

Newton's Method

Secant Method

Newton's Method

- Newton's method can be used to find a root of f (x) = 0, given f'(x), starting from initial guess x₀, preferably close to the solution.
- Start with the initial guess $x = x_{0.}$
- **2** Repeat using Newton's formula $x = x \frac{f(x)}{f'(x)}$.
- Stop when f (x) is close enough to 0 (or the number of iterations is too large).

Newton's Method

Secant Method

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Non-Convergence Math

- Newton's method could get stuck when f'(x) = 0.
- In that case, start with a different random initial guess.
- Newton's method could also diverge around an unstable root.
- In that case, a variation of Newton's method need to be used.

Bisection Method 00000000 Newton's Method

Secant Method

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Secant Method Step

- f(0) = 1, f(-1) = 0.5, f(1) = 1.5, there is a unique x such that f(x) = 0, then
- A: x is likely less than -1
- *B* : *x* is likely in [−1, 0]
- *C* : *x* is likely in [0,1]
- D : x is likely more than 1

Bisection Method 00000000 Newton's Method

Secant Method

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Secant Method Math

- Secant method is used instead of Newton's method when the derivative function is unknown or costly to compete.
- Two initial guesses are required, x₀ and x₁, and the Newton's update is replaced by

$$x = x - \frac{f(x)}{\frac{f(x) - f(x')}{x - x'}} = \frac{x'f(x) - xf(x')}{f(x) - f(x')}, \text{ where } x' \text{ is the } x$$

in the previous iteration.

Comparison with Newton's Method

- Secant method is not the same as Netwon's method with the numerical derivative computed using finite differences, but when x and x' are close, a step using Secant method does approximate a step using Newton's method.
- In general, Newton's method usually takes fewer iterations.
- If it is costly to evaluate f'(x), the secant method could be faster than Newton's method.

Bisection Method

Newton's Method

Secant Method

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

MATLAB Solver

- *fzero* (*f*, [x0, x1]) searches for the solution of f(x) = 0 between x_0 and x_1 , assuming $f(x_0) f(x_1) \leq 0$.
- fzero (f, x0) starts at x₀ and search for the solution of f (x) = 0 using a variation of the secant method.

Bisection Method

Newton's Method 00000 Secant Method

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Extension to System of Equations

Both Newton's method and Secant method can be extended to solving a system of non-linear equations F (x) = 0. The Jacobian matrix is used in place of the derivative. The updates are given by x = x - J_F⁻¹ (x) F (x).
