#### Reinforcement Learning Motivation

- Reinforcement learning is about learning from the outcome of actions.
- Sense world.
- 2 Reason.
- 3 Choose an action to perform.
- Get feedback.
- 6 Learn.

Multi Armed Bandits

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

#### Applications Motivation

- Actions can be performed in the physical world or artificial ones.
- Board games.
- Robotic control.
- Autonomous helicopter performance.
- Economics models.

Multi Armed Bandits •0000

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

#### Bandits Motivation

- There are K arms, pulling each arm i results in reward  $r_i$ .
- The reward  $r_i$  is random and a follows Gaussian distribution with mean reward  $\mu_i$  and variance  $\sigma^2 = 1$ .
- Suppose  $\mu_1 \ge \mu_2 \ge \mu_3 \ge ... \ge \mu_K$ .

Multi Armed Bandits

Q-Learning

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

# Exploration then Exploitation Algorithm

Pull each arm t times to estimate the mean reward.

$$\hat{\mu}_{i,t} = \frac{1}{n} \sum_{t'=1}^{t} r_{i,t'}$$

 $r_{i,t'}$  is the random reward from arm *i* and t' -th pull.

**2** Pull the arm  $i^*$  with the highest estimated mean reward.

$$i^{\star} = \arg \max_{i=1,2,\dots,K} \hat{\mu}_{i,t}$$

Multi Armed Bandits

Q-Learning

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

#### Upper Confidence Bound Algorithm Motivation

**1** Pull the arm  $i^*$  with the highest upper confidence bound.

$$i^{\star} = \arg \max_{i=1,2,\dots,K} \begin{cases} \text{UCB} = \hat{\mu}_{i,t} + \sqrt{\frac{2\log\left(\frac{1}{\delta}\right)}{t}} & t > 0\\ \infty & t = 0 \end{cases}$$

 $\delta$  is the confidence level parameter.

$$\mathbb{P}\left\{\mu_i \leqslant \hat{\mu}_{i,t} + \sqrt{\frac{2\log\left(\frac{1}{\delta}\right)}{t}}\right\} \leqslant 1 - \delta$$

# Bandit Applications

- Managing research projects.
- Treatment for patients.
- Search engine ranking.
- Wireless adaptive routing.
- Financial portfolio design.

Multi Armed Bandits

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 - のへで

- Select an action.
- Receive reward.
- Observe new state.
- Update (learn) the value of the state-action pair.

Multi Armed Bandits

Q-Learning

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

### State and Actions

- The set of possible states is  $s_t \in S$ .
- The set of possible actions is  $a_t \in A$ .
- The set of possible rewards is  $r_t \in R$ .
- At each time t :
- Observe state s<sub>t</sub>.
- Chooses action a<sub>t</sub>.
- 3 Receives reward  $r_t$ .
- Changes to state  $s_{t+1}$ .

Multi Armed Bandits

Q-Learning

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

#### Markov Decision Process Definition

• Markov property on states and actions is assumed.

$$\mathbb{P}\left\{s_{t+1}|s_{t}, a_{t}, s_{t-1}, a_{t-1}, ...\right\} = \mathbb{P}\left\{s_{t+1}|s_{t}, a_{t}\right\}$$
$$\mathbb{P}\left\{r_{t+1}|s_{t}, a_{t}, s_{t-1}, a_{t-1}, ...\right\} = \mathbb{P}\left\{r_{t+1}|s_{t}, a_{t}\right\}$$

 The goal is to learn a policy function π : S → A for choosing actions that maximize the total expected discounted reward.

$$\mathbb{E}\left[r_t + \gamma r_{t+1} + \gamma^2 r_{t+2} + \dots\right], \gamma \in [0, 1]$$

Multi Armed Bandits

Q-Learning

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

### Expected Reward

• The expected reward at a given time *t* is the average reward weighted by probabilities.

$$\mathbb{E}[r_t] = \sum_{r_t \in R} r_t \mathbb{P}\{r_t | s_{t-1}, a_{t-1}\}$$

Multi Armed Bandits

Q-Learning

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

#### Discounted Reward Definition

• The discounted reward at time 0 is the sum of reward weighted given the time preference, usually described by a constant discount factor.

$$\begin{aligned} \mathsf{PV} \ (r_t) &= \gamma^t r_t, \gamma \in [0,1] \\ \mathsf{PV} \ (r_1, r_2, \ldots) &= \sum_{t=0}^{\infty} \gamma^t r_t \end{aligned}$$

γ is the value of 1 unit of reward at time 1 perceived at time
 0. If γ = 1, the sum over an infinite time period is usually infinity, therefore γ < 1 is usually used.</li>

Multi Armed Bandits

Q-Learning

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

# Value Function

 The value function is the expected discounted reward given a policy function π, assuming the action sequence is chosen according to π stating with state s.

$$V^{\pi}(s) = \sum_{t=0}^{\infty} \gamma^{t} \mathbb{E}[r_{t}]$$

• The optimal policy  $\pi^{\star}$  is the one that maximizes the value function.

$$\begin{aligned} \pi^{\star} &= \arg\max_{\pi} V^{\pi}\left(s\right) \text{ for all } s \in S \\ V^{\star}\left(s\right) &= V^{\pi^{\star}}\left(s\right) \end{aligned}$$

#### Optimal Policy Given Value Function Definition

• Given  $V^{\star}\left(s
ight),r\left(s,a
ight),\mathbb{P}\left(s'|s,a
ight),\pi^{\star}$  can be computed directly.

$$\pi^{\star}(s) = \arg \max_{a \in A} \left( \mathbb{E} \left[ r | s, a \right] + \gamma \mathbb{E} \left[ V^{\star} \left( s' \right) | s, a \right] \right)$$
$$= \arg \max_{a \in A} \left( \sum_{r \in R} r \mathbb{P} \left\{ r | s, a \right\} + \gamma \sum_{s' \in S} \mathbb{P} \left\{ s' | s, a \right\} V^{\star} \left( s' \right) \right)$$

• Define the function inside the arg max as the Q function.

Multi Armed Bandits

#### Q Function Definition

$$V^{\star}(s) = \mathbb{E}\left[r|s, \pi^{\star}(s)\right] + \gamma \mathbb{E}\left[V^{\star}\left(s'\right)|s, \pi^{\star}(s)\right]$$
$$Q(s, a) = \mathbb{E}\left[r|s, a\right] + \gamma \mathbb{E}\left[V^{\star}\left(s'\right)|s, a\right]$$

 If the agent knows Q, then the optimal action can be learned without P {s' |s, a}.

$$\pi^{\star}\left(s\right) = \arg\max_{a} Q\left(s,a\right), V^{\star}\left(s\right) = \max_{a} Q\left(s,a\right)$$

# Deterministic Q Learning Definition

In the deterministic case, P {s'|s, a} is either 0 or 1, the update formula for the Q function is the following.

$$\hat{Q}(s, a) = r + \gamma \max_{a'} \hat{Q}(s', a')$$

Multi Armed Bandits

Q-Learning

### Q Learning Example, Part I

Definition

Multi Armed Bandits

#### Q Learning Example, Part II Definition

◆□▶ ◆□▶ ◆ 臣▶ ◆ 臣▶ ○ 臣 ○ の Q @

Multi Armed Bandits

Q-Learning

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

#### Non-Deterministic Q Learning Definition

• In the nondeterministic case, the update formula for the *Q* function is the following.

$$\begin{split} \hat{Q}\left(s,a\right) &= (1-\alpha) \, \hat{Q}\left(s,a\right) + \alpha \left(r + \gamma \max_{a'} \hat{Q}\left(s',a'\right)\right) \\ \alpha &= \frac{1}{1 + \text{ visits } (s,a)} \end{split}$$

• Q learning will converge to the correct Q function in both deterministic and non-deterministic cases. In practice, it takes a very large number of iterations.

Multi Armed Bandits

Q-Learning

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

## Q Learning, Part I

- Input: the state and reward processes.
- Output: optimal policy function  $\pi^{\star}(s)$
- Initialize the Q table.

$$\hat{Q}\left( old s,old a
ight) =0,\,\, ext{for each}\,old s\inold S,old a\in A$$

Multi Armed Bandits

Q-Learning

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

#### Q Learning, Part II

Algorithm

- Observe current state s.
- Select an action *a* and execute it.
- Receive immediate reward r.
- Observe the new state s'.
- Update the table entry.

$$\begin{split} \hat{Q}\left(s,a\right) &= \left(1-\alpha\right)\hat{Q}\left(s,a\right) + \alpha\left(r+\gamma\max_{a'}\hat{Q}\left(s',a'\right)\right)\\ \alpha &= \frac{1}{1+\text{ visits }\left(s,a\right)} \end{split}$$

• Update the state and repeat forever.

$$s = s'$$

Multi Armed Bandits

Q-Learning

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

#### Exploration vs Exploitation Discussion

• There is a trade-off between learning about possibly better alternatives and following the current policy. Sometimes, random actions should be selected.

$$\mathbb{P}\left\{\boldsymbol{a}|\boldsymbol{s}\right\} = \frac{c^{\hat{\mathcal{Q}}(\boldsymbol{s},\boldsymbol{a})}}{\sum\limits_{\boldsymbol{a}'\in\mathcal{A}}c^{\hat{\mathcal{Q}}(\boldsymbol{s},\boldsymbol{a}')}}$$

• c > 0 is a constant that determines how strongly selection favors actions with higher Q values.

Multi Armed Bandits

Q-Learning

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

# Q Table vs Q Net

- In practice, Q table is too large to store since the number of possible states is very large.
- If there are *m* binary features that represent the state, the Q table contains 2<sup>m</sup> |A|.
- However, it can be stored in a neural network called Q net.
- If there is a single hidden layer with m units, there are only  $m^2 + m |A|$  weights to store.

Multi Armed Bandits

Q-Learning

### Q Net Diagram

Discussion

Multi Armed Bandits

Q-Learning

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

#### Q Net Training Discussion

- Observe the features x given a state s.
- Apply action *a* and observe new state *s'* with features *x'* and reward *r*.
- Train the network with new instance (x, y)

$$y = (1 - \alpha) \hat{y}(x, a) + \alpha \left(r + \gamma \max_{a'} \hat{y}(x', a')\right)$$

- $\hat{y}(x, a)$  is the activation of output unit *a* given the input *x* in the current neural network.
- ŷ (x', a') is the activation output unit a' given the input x' in the current neural network.

Multi Armed Bandits

### Multi-Agent Learning

- Value function and policy function iteration methods can be applied to solve dynamic games with multiple agents.
- It will be used again in game theory in Week 11.
