Midterm Reivew Session

- June 29 Dan will go through selected Homework questions and Past Exam questions, not recorded, notes will be posted.
- Dandi will go through the same questions this Thursday and Friday (June 18 and 19)12 : 30 to 1 : 45 for section 1, you can use the guest link to attend too.

HMM Training

Special Bayesian Network for Sequences Motivation

- A sequence of features $X_1, X_2, ...$ can be modeled by a Markov Chain but they are not observable.
- A sequence of labels $Y_1, Y_2, ...$ depends only on the current hidden features and they are observable.
- This type of Bayesian Network is called a Hidden Markov Model.

HMM Training

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

HMM Applications Part 1 Motivation

- Weather prediction.
- Hidden states: $X_1, X_2, ...$ are weather that is not observable by a person staying at home (sunny, cloudy, rainy).
- Observable states: $Y_1, Y_2, ...$ are Badger Herald newspaper reports of the condition (dry, dryish, damp, soggy).
- Speech recognition.
- Hidden states: $X_1, X_2, ...$ are words.
- Observable states: $Y_1, Y_2, ...$ are acoustic features.

HMM Training

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

HMM Applications Part 2 Motivation

- Stock or bond prediction.
- Hidden states: X₁, X₂, ... are information about the company (profitability, risk measures).
- Observable states: $Y_1, Y_2, ...$ are stock or bond prices.
- Speech synthesis: Chatbox.
- Hidden states: $X_1, X_2, ...$ are context or part of speech.
- Observable states: $Y_1, Y_2, ...$ are words.

HMM Evaluation

HMM Training

Other HMM Applications

- Machine translation.
- Handwriting recognition.
- Gene prediction.
- Traffic control.

Transition and Likelihood Matrices

- An initial distribution vector and two-state transition matrices are used to represent a hidden Markov model.
- **1** Initial state vector: π .

$$\pi_i = \mathbb{P} \{ X_1 = i \}, i \in 1, 2, ..., |X|$$

2 State transition matrix: A.

$$A_{ij} = \mathbb{P}\left\{X_t = j | X_{t-1} = i\right\}, i, j \in \{1, 2, ..., |X|$$

Observation Likelihood matrix (or output probability distribution): B.

$$B_{ij} = \mathbb{P}\left\{Y_t = i | X_t = j\right\}, i \in 1, 2, ..., |Y|, j \in 1, 2, ..., |X|$$

Markov Property Motivation

 The Markov property implies the following conditionally independent property.

$$\mathbb{P} \{ x_t | x_{t-1}, x_{t-2}, ..., x_1 \} = \mathbb{P} \{ x_t | x_{t-1} \}$$
$$\mathbb{P} \{ y_t | x_t, x_{t-1}, ..., x_1 \} = \mathbb{P} \{ y_t | x_t \}$$

Evaluation and Training Motivation

- There are three main tasks associated with an HMM.
- Evaluation problem: finding the probability of an observed sequence given an HMM: y₁, y₂, ...
- Obecoding problem: finding the most probable hidden sequence given the observed sequence: x₁, x₂, ...
- Learning problem: finding the most probable HMM given an observed sequence: π, A, B, ...

HMM Training

Expectation-Maximization Algorithm Description

- Start with a random guess of π , A, B.
- Compute the forward probabilities: the joint probability of an observed sequence and its hidden state.
- Compute the backward probabilities: the probability of an observed sequence given its hidden state.
- Update the model π , A, B using Bayes rule.
- Repeat until convergence.
- Sometimes, it is called the Baum-Welch Algorithm.

HMM Evaluation

HMM Training

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬる

Evaluation Problem

• The task is to find the probability $\mathbb{P}\{y_1, y_2, ..., y_T | \pi, A, B\}$.

$$\mathbb{P} \{ y_1, y_2, ..., y_T | \pi, A, B \}$$

= $\sum_{x_1, x_2, ..., x_T} \mathbb{P} \{ y_1, y_2, ..., y_T | x_1, x_2, ..., x_T \} \mathbb{P} \{ x_1, x_2, ..., x_T \}$
= $\sum_{x_1, x_2, ..., x_T} \left(\prod_{t=1}^T B_{y_t x_t} \right) \left(\pi_{x_1} \prod_{t=2}^T A_{x_{t-1} x_t} \right)$

• This is also called the Forward Algorithm.

Evaluation Problem Example, Part 1

- Fall 2018 Final Q28 and Q29
- Compute $\mathbb{P} \{ X_4 = Y, X_5 = Z | X_3 = X \}.$
- Compute $\mathbb{P} \{ X_1 = X, X_2 = Z | Y_1 = A, Y_2 = B \}.$

Decoding Problem

- The task is to find $x_1, x_2, ..., x_T$ that maximizes $\mathbb{P} \{x_1, x_2, ..., x_T | y_1, y_2, ..., y_T, \pi, A, B\}.$
- Direct computation is too expensive.
- Dynamic programming needs to be used to save computation.
- This is called the Viterbi Algorithm.

HMM Training

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Viterbi Algorithm Value Function

• Define the value functions to keep track of the maximum probabilities at each time *t* and for each state *k*.

$$V_{1,k} = \mathbb{P} \{ y_1 | X_1 = k \} \cdot \mathbb{P} \{ X_1 = k \}$$

= $B_{y_1k} \pi_k$
 $V_{t,k} = \max_x \mathbb{P} \{ y_t | X_t = k \} \mathbb{P} \{ X_t = k | X_{t-1} = x \} V_{t-1,k}$
= $\max_x B_{y_tk} A_{kx} V_{t-1,k}$

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Viterbi Algorithm Policy Function

• Define the policy functions to keep track of the x_t that maximizes the value function.

policy
$$_{t,k} = \arg \max_{x} B_{y_tk} A_{kx} V_{t-1,k}$$

• Given the policy functions, the most probable hidden sequence can be found easily.

$$x_{T} = \arg \max_{x} V_{T,x}$$
$$x_{t} = \text{ policy }_{t+1,x_{t+1}}$$

Expectation-Maximization Algorithm (for HMM), Part 1 Algorithm

• Initialize the hidden Markov model.

$$\pi \sim \mathsf{D} \left(\left| X \right| \right), A \sim \mathsf{D} \left(\left| X \right|, \left| X \right| \right), B \sim \mathsf{D} \left(\left| Y \right|, \left| X \right| \right)$$

• Perform the forward pass.

$$\alpha_{i,t} \text{ represents } \mathbb{P} \{ y_1, y_2, ..., y_t, X_t = i | \pi, A, B \}$$

$$\alpha_{i,1} = \pi_i B_{y_1,i}$$

$$\alpha_{i,t+1} = \sum_{j=1}^{|X|} \alpha_{j,t} A_{ji} B_{y_{t+1}i}$$

HMM Evaluation

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Expectation-Maximization Algorithm (for HMM), Part 2 Algorithm

• Perform the backward pass.

$$\begin{split} \beta_{i,t} \text{ represents } \mathbb{P} \left\{ y_{t+1}, y_{t+2}, ..., y_T | X_t = i, \pi, A, B \right\} \\ \beta_{i,T} &= 1 \\ \beta_{i,t} &= \sum_{j=1}^{|X|} A_{ij} B_{y_{t+1}j} \beta_{j,t+1} \end{split}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Expectation-Maximization Algorithm (for HMM), Part 3 Algorithm

• Define the conditional hidden state probabilities for each training sequence *n*.

$$\gamma_{n,i,t} = \text{ represents } \mathbb{P} \{ X_t = i | y_1, y_2, ..., y_T, \pi, A, B \}$$

$$\gamma_{n,i,t} = \frac{\alpha_{i,t} \beta_{i,t}}{\sum_{j=1}^{|X|} \alpha_{j,t} \beta_{j,t}}$$

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Expectation-Maximization Algorithm (for HMM), Part 4 Algorithm

• Define the conditional hidden state probabilities for each training sequence *n*.

$$\begin{aligned} \xi_{n,i,j,t} \text{ represents } \mathbb{P} \left\{ X_t = i, X_{t+1} = j | y_1, y_2, ..., y_T, \pi, A, B \right\} \\ \xi_{n,i,j,t} &= \frac{\alpha_{i,t} A_{ij} \beta_{j,t+1} B_{y_{t+1}j}}{\sum_{k=1}^{|X|} \sum_{l=1}^{|X|} \alpha_{k,t} A_{kl} \beta_{l,t+1} B_{y_{t+1}w}} \end{aligned}$$

HMM Evaluation

Expectation-Maximization Algorithm (for HMM), Part 5

• Update the model.

$$\pi'_{i} = \frac{\sum_{n=1}^{N} \gamma_{n,i,1}}{N} \\ A'_{ij} = \frac{\sum_{n=1}^{N} \sum_{t=1}^{T-1} \xi_{n,i,j,t}}{\sum_{n=1}^{N} \sum_{t=1}^{T-1} \gamma_{n,i,t}}$$

Expectation-Maximization Algorithm (for HMM), Part 6 Algorithm

• Update the model, continued.

$$B'_{ij} = \frac{\sum_{n=1}^{N} \sum_{t=1}^{T} \mathbb{1}_{\{y_{n,t}=j\}}\gamma_{n,i,t}}{\sum_{n=1}^{N} \sum_{t=1}^{T} \gamma_{n,i,t}}$$

• Repeat until π, A, B converge.
