## Feedback

- Please give me feedback on lectures, homework, exams on Socrative, room CS540A.
- Please report bugs in homework, lecture examples and quizzes on Piazza.
- Please do NOT leave comments on YouTube.
- Email me (Young Wu) for personal issues.
- Email the supervisory instructor (Eftychios Sifakis) for issues with me.

### Supervised Learning

Motivation

Data	Features (Input)	Output	-
Training	$\{(x_{i1},,x_{im})\}_{i=1}^{n'}$	$\{y_i\}_{i=1}^{n'}$	find "best" $\hat{f}$
-	observable	known	-
Test	$(x'_1,, x'_m)$	y'	guess $\hat{y} = \hat{f}(x')$
-	observable	unknown	-

## Loss Function Diagram

Logistic Regression

Gradient Descent 000000

### Zero-One Loss Function

• An objective function is needed to select the "best"  $\hat{f}$ . An example is the zero-one loss.

$$\hat{f} = \arg\min_{f} \sum_{i=1}^{n} \mathbb{1}_{\{f(x_i) \neq y_i\}}$$

- arg min objective (f) outputs the function that minimizes the objective.
- The objective function is called the cost function (or the loss function), and the objective is to minimize the cost.

Gradient Descent 000000

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

## Squared Loss Function

- Zero-one loss counts the number of mistakes made by the classifier. The best classifier is the one that makes the fewest mistakes.
- Another example is the squared distance between the predicted and the actual *y* value:

$$\hat{f} = \arg\min_{f} \frac{1}{2} \sum_{i=1}^{n} (f(x_i) - y_i)^2$$

# Function Space Diagram

Logistic Regression

Gradient Descent 000000

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

## Hypothesis Space

- There are too many functions to choose from.
- There should be a smaller set of functions to choose  $\hat{f}$  from.

$$\hat{f} = \arg\min_{f \in \mathcal{H}} \frac{1}{2} \sum_{i=1}^{n} (f(x_i) - y_i)^2$$

 $\bullet\,$  The set  ${\cal H}$  is called the hypothesis space.

Logistic Regression

Gradient Descent

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

# Linear Regression

• For example,  $\mathcal{H}$  can be the set of linear functions. Then the problem can be rewritten in terms of the weights.

$$(\hat{w}_1, ..., \hat{w}_m, \hat{b}) = \arg \min_{w_1, ..., w_m, b} \frac{1}{2} \sum_{i=1}^n (a_i - y_i)^2$$
  
where  $a_i = w_1 x_{i1} + w_2 x_{i2} + ... + w_m x_{im} + b$ 

• The problem is called (least squares) linear regression.

Logistic Regression

Gradient Descent 000000

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

## Binary Classification

- If the problem is binary classification, y is either 0 or 1, and linear regression is not a great choice.
- This is because if the prediction is either too large or too small, the prediction is correct, but the cost is large.

Logistic Regression

Gradient Descent 000000

## Binary Classification Linear Regression Diagram

Logistic Regression

Gradient Descent 000000

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

## Activation Function

• Suppose  $\mathcal{H}$  is the set of functions that are compositions between another function g and linear functions.

$$\left(\hat{w}, \hat{b}\right) = \arg\min_{w,b} \frac{1}{2} \sum_{i=1}^{n} (a_i - y_i)^2$$
  
where  $a_i = g\left(w^T x + b\right)$ 

• g is called the activation function.

Logistic Regression

Gradient Descent 000000

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

#### Linear Threshold Unit Motivation

• One simple choice is to use the step function as the activation function:

$$g\left(\bigcirc\right) = \mathbb{1}_{\left\{\bigcirc\geqslant 0\right\}} = \begin{cases} 1 & \text{if } \bigcirc \geqslant 0\\ 0 & \text{if } \bigcirc < 0 \end{cases}$$
(1)

• This activation function is called linear threshold unit (LTU).

 Gradient Descent 000000

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

### Sigmoid Activation Function Motivation

• When the activation function g is the sigmoid function, the problem is called logistic regression.

$$g\left( \bigcirc 
ight) = rac{1}{1 + \exp\left( - \bigcirc 
ight)}$$

• This g is also called the logistic function.

#### Sigmoid Function Diagram Motivation

Logistic Regression

Gradient Descent 000000

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

### Cross-Entropy Loss Function Motivation

• The cost function used for logistic regression is usually the log cost function.

$$C(f) = -\sum_{i=1}^{n} (y_i \log (f(x_i)) + (1 - y_i) \log (1 - f(x_i)))$$

• It is also called the cross-entropy loss function.

Logistic Regression

Gradient Descent

#### Logistic Regression Objective Motivation

• The logistic regression problem can be summarized as the following.

$$\begin{pmatrix} \hat{w}, \hat{b} \end{pmatrix} = \arg\min_{w, b} - \sum_{i=1}^{n} \left( y_i \log \left( a_i \right) + (1 - y_i) \log \left( 1 - a_i \right) \right)$$
where  $a_i = \frac{1}{1 + \exp \left( -z_i \right)}$  and  $z_i = w^T x_i + b$

# Logistic Regression

- Initialize random weights.
- Evaluate the activation function.
- Compute the gradient of the cost function with respect to each weight and bias.
- Update the weights and biases using gradient descent.
- Repeat until convergent.

Gradient Descent 000000

# Gradient Descent Intuition Definition

- If a small increase in w<sub>1</sub> causes the distances from the points to the regression line to decrease: increase w<sub>1</sub>.
- If a small increase in w<sub>1</sub> causes the distances from the points to the regression line to increase: decrease w<sub>1</sub>.
- The change in distance due to change in  $w_1$  is the derivative.
- The change in distance due to change in  $\begin{bmatrix} w \\ b \end{bmatrix}$  is the gradient.

Gradient Descent 000000

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

#### Gradient Definition

- The gradient is the vector of derivatives.
- The gradient of  $f(x_i) = w^T x_i + b = w_1 x_{i1} + w_2 x_{i2} + ... + w_m x_{im} + b$  is:

$$\nabla_{w}f = \begin{bmatrix} \frac{\partial f}{\partial w_{1}} \\ \frac{\partial f}{\partial w_{2}} \\ \dots \\ \frac{\partial f}{\partial w_{m}} \end{bmatrix} = \begin{bmatrix} x_{i1} \\ x_{i2} \\ \dots \\ x_{im} \end{bmatrix} = x_{i}$$
$$\nabla_{b}f = 1$$

Logistic Regression

Gradient Descent

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

## Chain Rule

• The gradient of  $f(x_i) = g(w^T x_i + b) = g(w_1 x_{i1} + w_2 x_{i2} + ... + w_m x_{im} + b)$ can be found using the chain rule.

$$\nabla_{w}f = g'\left(w^{T}x_{i}+b\right)x_{i}$$
$$\nabla_{b}f = g'\left(w^{T}x_{i}+b\right)$$

• In particular, for the logistic function g :

$$g\left(\overline{\phantom{x}}\right) = \frac{1}{1 + \exp\left(-\overline{\phantom{x}}\right)}$$
$$g'\left(\overline{\phantom{x}}\right) = g\left(\overline{\phantom{x}}\right)\left(1 - g\left(\overline{\phantom{x}}\right)\right)$$

## Logistic Gradient Derivation 2

Logistic Regression

Gradient Descent

## Gradient Descent Step

• For logistic regression, use chain rule twice.

$$w = w - \alpha \sum_{i=1}^{n} (a_i - y_i) x_i$$
$$b = b - \alpha \sum_{i=1}^{n} (a_i - y_i)$$
$$a_i = g\left(w^T x_i + b\right), g\left(\overline{\cdot}\right) = \frac{1}{1 + \exp\left(-\overline{\cdot}\right)}$$

 α is the learning rate. It is the step size for each step of gradient descent.

Logistic Regression

Gradient Descent

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

### Perceptron Algorithm

• Update weights using the following rule.

$$w = w - \alpha (a_i - y_i) x_i$$
$$b = b - \alpha (a_i - y_i)$$
$$a_i = \mathbb{1}_{\{w^T x_i + b \ge 0\}}$$

Logistic Regression

Gradient Descent

## Learning Rate Diagram

Gradient Descent 000000

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

### Logistic Regression, Part 1 Algorithm

- Inputs: instances:  $\{x_i\}_{i=1}^n$  and  $\{y_i\}_{i=1}^n$
- Outputs: weights and biases:  $w_1, w_2, ..., w_m$  and b
- Initialize the weights.

$$w_1, ..., w_m, b \sim$$
 Unif  $[-1, 1]$ 

• Evaluate the activation function.

$$a_i = g\left(w^T x_i + b\right), g\left(\boxed{\cdot}\right) = \frac{1}{1 + \exp\left(-\boxed{\cdot}\right)}$$

Logistic Regression

Gradient Descent 000000

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

#### Logistic Regression, Part 2 Algorithm

• Update the weights and bias using gradient descent.

$$w = w - \alpha \sum_{i=1}^{n} (a_i - y_i) x_i$$
$$b = b - \alpha \sum_{i=1}^{n} (a_i - y_i)$$

• Repeat the process until convergent.

$$|C - C^{\text{prev}}| < \varepsilon$$

Gradient Descent 000000

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

# Stopping Rule and Local Minimum

- Start with multiple random weights.
- Use smaller or decreasing learning rates. One popular choice is  $\frac{\alpha}{\sqrt{t}}$ , where t is the iteration count.
- Use the solution with the lowest *C*.

Logistic Regression

Gradient Descent

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

# Regression vs Classification

- Logistic regression is usually used to solve classification problems (y is discrete or categorical), not regression problems (y is continuous).
- This course (and machine learning in general) will focus on solving classification problems.

Gradient Descent •00000

## Other Non-linear Activation Function

- Activation function:  $g(\overline{\cdot}) = \tanh(\overline{\cdot}) = \frac{e^{|\cdot|} e^{-|\cdot|}}{e^{|\cdot|} + e^{-|\cdot|}}$
- Activation function:  $g(\overline{\cdot}) = \arctan(\overline{\cdot})$
- Activation function (rectified linear unit):  $g(\bigcirc) = \bigcirc \mathbb{1}_{\{\bigcirc \ge 0\}}$
- All these functions lead to objective functions that are convex and differentiable (almost everywhere). Gradient descent can be used.

Logistic Regression

Gradient Descent

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

## Convexity Diagram

Gradient Descent

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

### Convexity Discussion

- If a function is convex, gradient descent with any initialization will converge to the global minimum (given sufficiently small learning rate).
- If a function is not convex, gradient descent with different initializations may converge to different local minima.
- A twice differentiable function is convex if and only its second derivative is non-negative.
- In the multivariate case, it means the Hessian matrix is positive semidefinite.

Logistic Regression

Gradient Descent

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

### Positive Semidefinite

Hessian matrix is the matrix of second derivatives:

$$H: H_{ij} = \frac{\partial^2 f}{\partial x_i \partial x_j}$$

- A matrix H is positive semidefinite if  $x^T H x \ge 0 \ \forall x \in \mathbb{R}^n$ .
- A symmetric matrix is positive semidefinite if and only if all of its eigenvalues are non-negative.
