

Quiz2 in guest lecture RL

Q 7. 12. 13. 14

Q7

$84 \times 84 \times 1 \Rightarrow 7 \times 7 \times 2$ zero pad=3 (mode="same") $\Rightarrow 90 \times 90 \times 1$

$\Rightarrow 84 \times 84 \times 2 \Rightarrow 3 \times 3$ pooling

$\Rightarrow 28 \times 28 \times 2 \Rightarrow (28 \times 28 \times 2) \times 4$

$\Rightarrow 4$

Q12

-4 -3 -2 8 10 22

Red in blue's 3nn

Blue is not in red's 3nn

Q13

5 kids

(1) We know one of them is girl $P(\text{boy} \geq 1 \mid \text{Amy} = \text{girl})$

(2) We know there is a girl $P(\text{boy} \geq 1 \mid \text{there is a girl})$

(1) $P(\# \text{ boy} \geq 1 \mid \text{Amy} = \text{girl}, \text{there are 5 kids})$

$$= P(\# \text{ boy} \geq 1 \mid \text{there are 4 unknown kids}) = 1 - 0.5^4$$

(2) $P(\# \text{ boy} \geq 1 \mid \text{there is at least one girl in 5 kids})$

$= P(\# \text{ boy} \geq 1, \text{there is at least one girl in 5 kids}) / P(\text{there is at least one girl in 5 kids})$

$$= (1 - 0.5^5 - 0.5^5) / (1 - 0.5^5) = 30/31$$

$P(\# \text{ boy} = 5) \quad P(\# \text{ girl} = 5)$

Q14

S0 S1 S2 $s_0 = [1, 0, 0]$

O0, O1. o_0

$T = [0.38, 0.2, 0.42;$

$0.33, 0.37, ?;$

$?, ?, ?]$

$s_1 = s_0 * T$

$s_2 = s_0 * T * T$

$P(\text{happy/angry} | S_1/S_2/S_3)$

$P(o_0=O_1, o_1=O_0 | s_0=[1, 0, 0])$

$P(o_T=O_1, o_{(T+1)}=O_0 | s_0=[1, 0, 0])$ when $T \rightarrow \infty$

$$s_1 = s_0 * T$$

$$s_2 = s_1 * T$$

.....

$$T = [0.38, 0.2, 0.42;$$

$$?, ?, ?;$$

$$?, ?, ?]$$

T is a transition matrix

Q?: what is s_t when $t \rightarrow \infty$

$$s_t = [?, ?, ?]$$

We know T

We need to calculate s_t when $t \rightarrow \infty$

$$S_0 = [0.5, 0.5]$$

$$v_1 = [1, 0]$$

$$v_2 = [0, 1]$$

$$\langle v_i, v_j \rangle = 0$$

$$S_0 = 0.5 * v_1 + 0.5 * v_2$$

$\Phi(x_1)$

$\phi(x_2)$

- [$\langle \phi(x_1), \phi(x_1) \rangle$, [$\langle \phi(x_1), \phi(x_2) \rangle$];
- $\langle \phi(x_2), \phi(x_1) \rangle$, [$\langle \phi(x_2), \phi(x_2) \rangle$]

Statement for T (n by n): n states. $P(S_a \rightarrow S_a) + P(S_a \rightarrow S_b) + P(S_a \rightarrow S_c) + \dots$

T: sum of each row of the T is 1

All element of T ≥ 0

For this T

$$V * T = \lambda * V$$

One of the lambdas is 1, all the other is smaller than 1

$$V * T = V \text{ when } \lambda = 1$$

$$V * T < V \text{ when } \lambda < 1$$

$$s_0, s_1 = s_0 * T, s_2 = s_0 * T * T, s_3 = s_0 * T * T * T$$

$$s_0 = a_1 * v_1 + a_2 * v_2 + a_3 * v_3 + \dots$$

$$s_0 * (T^N) = a_1 * v_1 * T^N + a_2 * v_2 * T^N + a_3 * v_3 * \lambda^N \dots$$

$$= a_1 * v_1 + a_2 * v_2 \quad \text{when } N \rightarrow \infty$$

Q11

- 10 features
- 3 possible split
- Passed 6 split 0->1->2->3->4->5->6->10*3

A,b,c, d,e,f,g

Use another feature

d,e, f,g

3.5

Candidate split: 1.5, 2.5, 3.5
