Bridge and Torch Game

• Four people with one flashlight (torch) want to go across a river. The bridge can hold two people at a time, and they must cross with the flashlight. The time it takes for each person to cross the river:

| А | В | С | D |
|---|---|---|---|
| 1 | 2 | 4 | 5 |

- What is the minimum total time required for everyone to cross the river?
- A : 10, B: 11, C: 12, D: 13, E: 14

Performance Definition

- A search strategy is complete if it finds at least one solution.
- A search strategy is optimal if it finds the optimal solution.
- For uninformed search, the costs are assumed to be 1 for all edges c = 1.

BFS

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Complexity Definition

- The time complexity of a search strategy is the worst case maximum number of vertices expanded.
- The space complexity of a search strategy is the worst case maximum number of states stored in the frontier at a single time.
- Notation: the goals are *d* edges away from the initial state. This means assuming a constant cost of 1, the optimal solution has cost *d*. The maximum depth of the graph is *D*.
- Notation: the branching factor is *b*, the maximum number of actions associated with a state.

$$b = \max_{s \in V} \left| s'\left(s\right) \right|$$

BFS Example 2

- Suppose the states are integers between 1 and 2¹⁰ = 1024. The initial state is 1, and the goal state is 1024. The successors of a state *i* are 2*i* and 2*i* + 1, if exist. How many states are expanded during a BFS search?
- A : 10
- *B* : 11
- C : 12
- D : 1023
- *E* : 1024

BFS Example 3

- Suppose the states are integers between 1 and 2¹⁰ 1 = 1023. The initial state is 1, and the goal state is 1023. The successors of a state *i* are 2*i* and 2*i* + 1, if exist. How many states are expanded during a BFS search?
- A : 10
- *B* : 11
- C : 12
- D : 1023
- *E* : 1024

BFS 00000000

Breadth First Search Performance

- BFS is complete.
- BFS is optimal with c = 1.

BFS 0000000

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

Breadth First Search Complexity

• Time complexity: the worst case occurs when the goal is the last vertex at depth *d*.

$$T = b + b^2 + \ldots + b^d$$

• Space complexity: the worst case is storing all vertices at depth *d* is in the frontier.

$$S = b^d$$

Depth First Search Performance

Discussion

- DFS is incomplete if $D = \infty$.
- DFS is not optimal.

BFS 0000000 ▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Depth First Search Complexity

Time complexity: the worst case occurs when the goal is the root of the last subtree expanded in the whole graph.

$$T = b^{D-d+1}...+b^{D-1}+b^{D}$$

• Space complexity: the worst case is storing all vertices sharing the parents with vertices in the current path.

$$S = (b-1)D + 1$$

IDS Example 1

Suppose the states are positive integers between 1 and 10, initial state is 1, goal state is 9, successors of *i* is 2*i* and 2*i* + 1 (if exist). What a IDS expansion sequence?

BFS 0000000 ▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

IDS Example 1 Diagram

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Iterative Deepening Search Performance

- IDS is complete.
- IDS is optimal with c = 1.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Iterative Deepening Search Complexity Discussion

• Time complexity: the worst case occurs when the goal is the last vertex at depth *d*.

$$T = db + (d - 1)b^{2} + \dots + 3b^{d-2} + 2b^{d-1} + 1b^{d}$$

• Space complexity: it has the same space complexity as DFS. $S = (b-1) \ d$

Summary Discussion

- Search:
- Uninformed: Breadth first search → Add states at the end → Remove states from the front → Complete + Optimal.
- ② Uninformed: Depth first search → Add states to the front → Remove states to the front → Incomplete + Not optimal.
- Oninformed: Itervative deepening search → DFS with depth limits 1, 2, ... → Complete + Optimal.
- Informed: Uniform cost search
- Informed: Best first greedy search
- Informed: A search
- Informed: A star search
