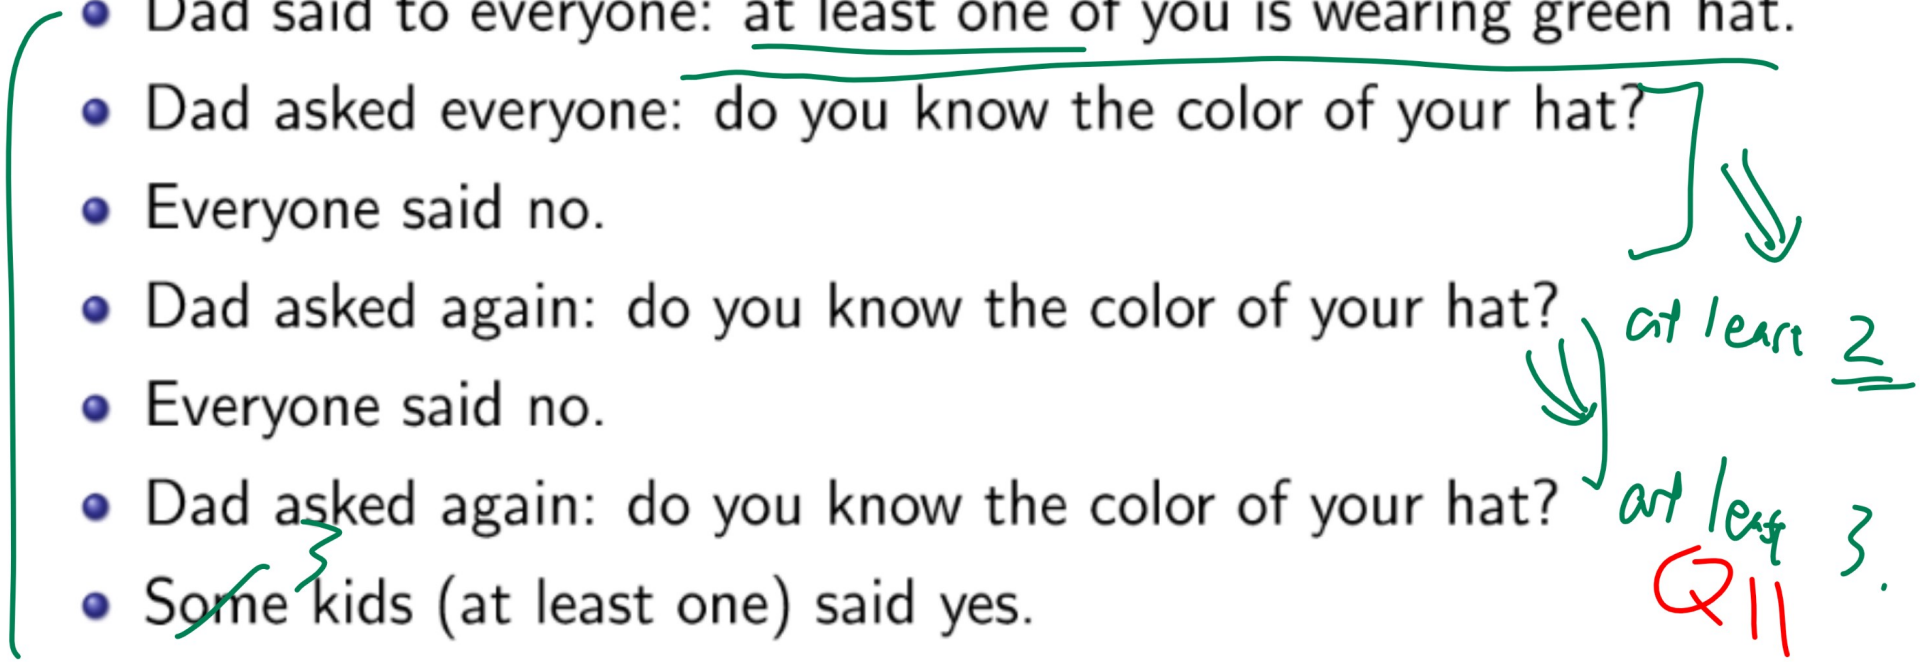
Hat Game

Quiz

- 5 kids are wearing either green or red hats in a party: they can see every other kid's hat but not their own.
- Dad said to everyone: at least one of you is wearing green hat.
- Dad asked everyone: do you know the color of your hat?
- Everyone said no.
- Dad asked again: do you know the color of your hat?
- Everyone said no.
- Dad asked again: do you know the color of your hat?
- Some kids (at least one) said yes.
- No one lied. How many kids are wearing green hats?
- A: 1... B: 2... C: 3... D: 4... E: 5

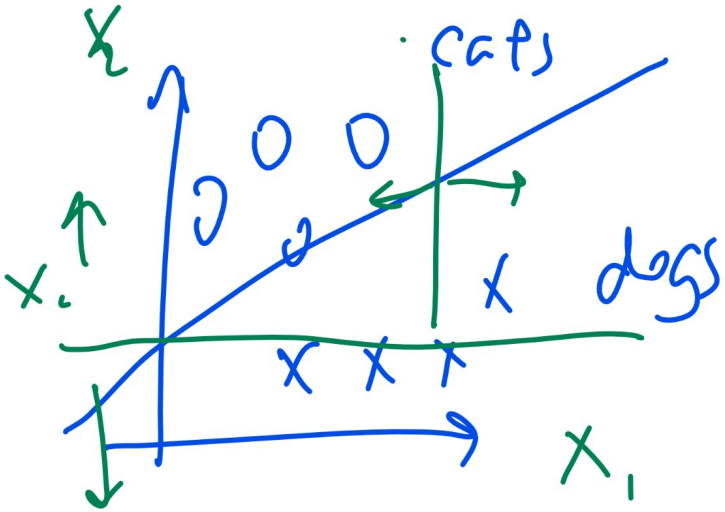


Hat Game Diagram

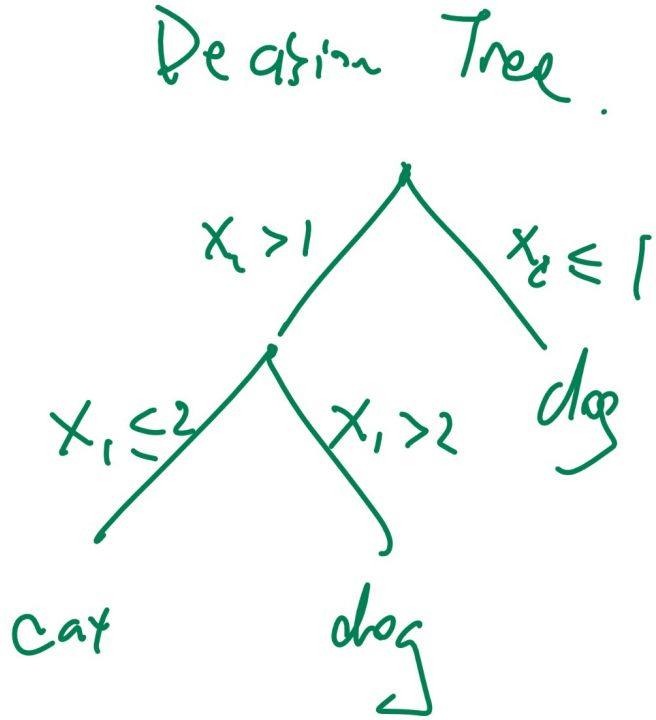
Discussion

Axes Aligned Decision Boundary

Motivation

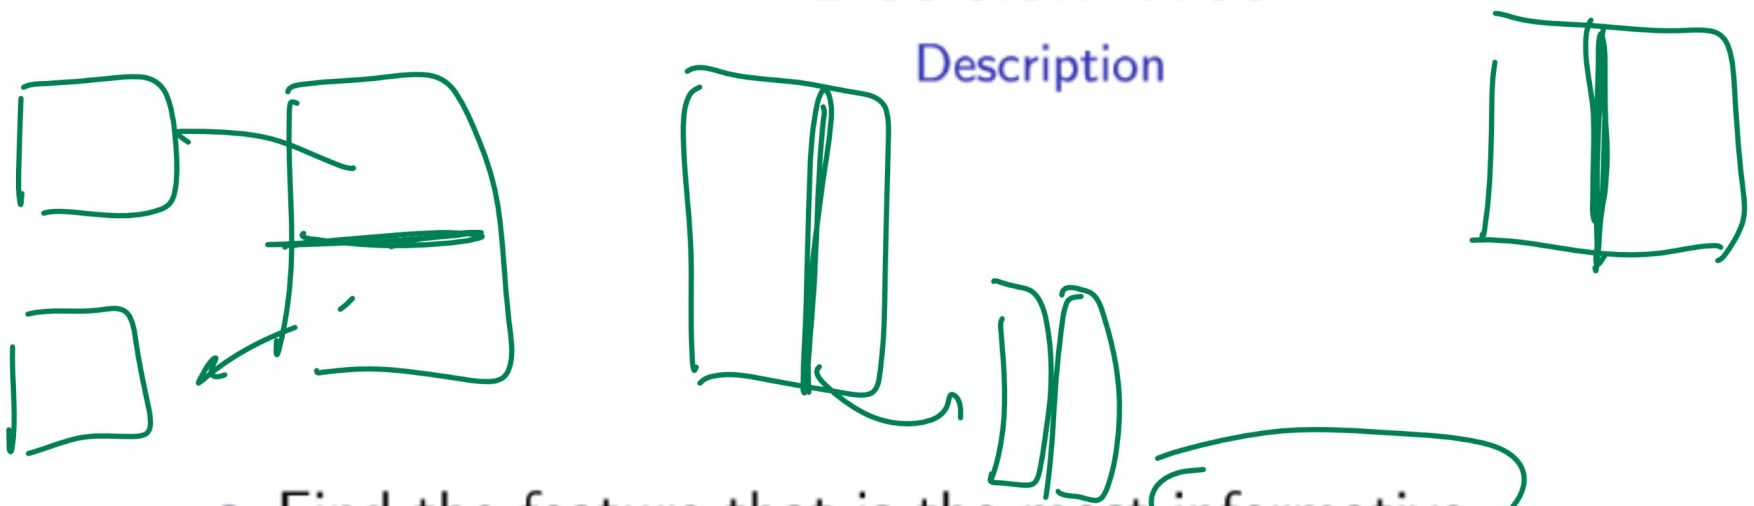


$$f(x^T w + b)$$



Decision Tree

Description



- Find the feature that is the most informative.
- Split the training set into subsets according to this feature.
- Repeat on the subsets until all the labels in the subset are the same.

Binary Entropy

Definition

- Entropy is the measure of uncertainty.
- The value of something uncertain is more informative than the value of something certain.
- For binary labels, $y_i \in \{0, 1\}$, suppose p_0 fraction of labels are 0 and $1 - p_0 = p_1$ fraction of the training set labels are 1, the entropy is:

$$\begin{aligned} H(Y) &= p_0 \log_2\left(\frac{1}{p_0}\right) + p_1 \log_2\left(\frac{1}{p_1}\right) \\ &= -p_0 \log_2(p_0) - p_1 \log_2(p_1) \end{aligned}$$

Entropy

Definition

- If there are K classes and p_y fraction of the training set labels are in class y, with $y \in \{1, 2, ..., K\}$, the entropy is:

$$H(Y) = \sum_{y=1}^{K} p_y \log_2 \left(\frac{1}{p_y} \right)$$

$$= - \sum_{y=1}^{K} p_y \log_2 (p_y)$$

Entropy

Quiz

- Running from You-Know-Who, Harry enters the CS building on the 1st floor. He flips a fair coin: if it is heads he hides in room 1325; otherwise, he climbs to the 2nd floor. In that case, he flips the coin again: if it is heads he hides in CSL; otherwise, he climbs to the 3rd floor and hides in 3331. What is the entropy of Harry's location?

$-\sum p_i \log_2 p_i$

1325	CSL	3331
$\frac{1}{2}$	$\frac{1}{4}$	$\frac{1}{4}$

$-\frac{1}{2}\log_2\frac{1}{2} - \frac{1}{4}\log_2\frac{1}{4} - \frac{1}{4}\log_2\frac{1}{4} = \frac{1}{2} + \frac{1}{2} + \frac{1}{2} = 1.5$

Entropy Math

Quiz

Entropy 2

Quiz

- A bag contains a red ball, a green ball, a blue ball, and a black ball. Randomly draw a ball from the bag with equal probability. What is the entropy of the outcome?
- $A : 1$
- $B : \log_2(3)$
- $C : 1.5$
- $D : 2$
- $E : 4$

Q10.

$-\sum p_i \log_2 p_i$

~~$\frac{1}{3} \log \frac{1}{3}$~~

$-\frac{1}{4} \log \frac{1}{4} \cdot 4$

(2)

Conditional Entropy

Definition

- Conditional entropy is the entropy of the conditional distribution. Let K_X be the possible values of a feature X and K_Y be the possible labels Y. Define p_x as the fraction of the instances that are x, and $p_{y|x}$ as the fraction of the labels that are y among the ones with instance x.

$$H(Y|X=x) = -\sum_{y=1}^{K_Y} p_{y|x} \log_2 \left(p_{y|x}\right)$$

$$H(Y|X) = \sum_{x=1}^{K_X} p_x H(Y|X=x)$$

$p_{y=1|x}$

$p_{y=0|x}$

Aside: Cross Entropy

Definition

- Cross entropy measures the difference between two distributions.

$$H(Y, X) = -\sum_{z=1}^{K} p_{Y=z} \log_2 (p_{X=z})$$

- It is used in logistic regression to measure the difference between actual label Y_i and the predicted label A_i for instance i, and at the same time, to make the cost convex.

$$H(Y_i, A_i) = -y_i \log(a_i) - (1 - y_i) \log(1 - a_i)$$

Information Gain

Definition

- The information gain is defined as the difference between the entropy and the conditional entropy.

$$I(Y|X) = H(Y) - H(Y|X).$$

- The larger than information gain, the larger the reduction in uncertainty, and the better predictor the feature is.

Splitting Discrete Features

Definition

- The most informative feature is the one with the largest information gain.

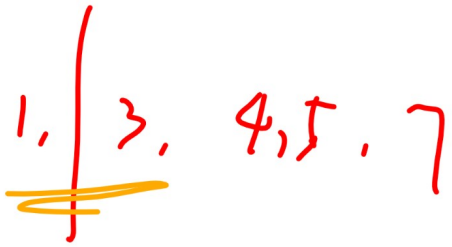
$$\underset{j}{\operatorname{argmax}}\, I\left(Y|X_j\right)$$

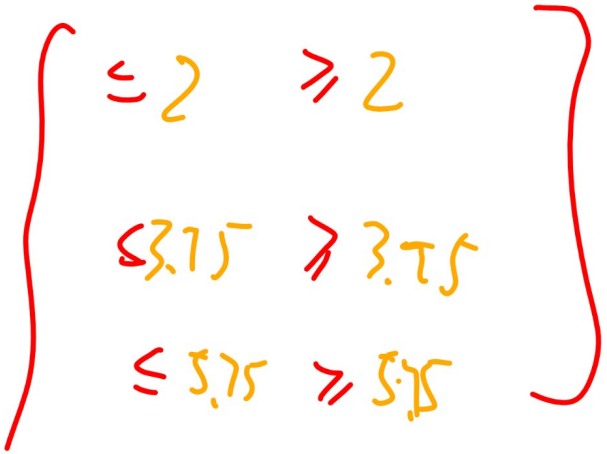
- Splitting means dividing the training set into K_{X_j} subsets.

$$\left\{(x_i, y_i) : x_{ij} = 1\right\}, \left\{(x_i, y_i) : x_{ij} = 2\right\}, ..., \left\{(x_i, y_i) : x_{ij} = K_{X_j}\right\}$$

Splitting Continuous Variables Diagram

Definition





find the one with largest IG into gain

ID3 Algorithm (Iterative Dichotomiser 3)

Description

- Find the feature that is the most informative.
- Split the training set into subsets according to this feature.
- Repeat on the subsets until all the labels in the subset are the same.

K Nearest Neighbor

Description

- Given a new instance, find the K instances in the training set that are the closest.
- Predict the label of the new instance by the majority of the labels of the K instances.

Distance Function

Definition

- Many distance functions can be used in place of the Euclidean distance.

$$\rho\left(x, x'\right) = \left\|x - x'\right\|_2 = \sqrt{\sum_{j=1}^{m} \left(x_j - x'_j\right)^2}$$

- An example is Manhattan distance.

$$\rho\left(x, x'\right) = \sum_{j=1}^{m} \left|x_j - x'_j\right|$$

Manhattan Distance Diagram

Definition

1 Nearest Neighbor

Quiz

- Find the 1 Nearest Neighbor label for $\begin{bmatrix} 3 \\ 6 \end{bmatrix}$ using Manhattan distance.

x_1	1	1	3	5	2
x_2	1	7	3	4	5
y	0	1	1	0	0

- $A : 0$
- $B : 1$

3 Nearest Neighbor

Quiz

- Find the 3 Nearest Neighbor label for $\begin{bmatrix} 3 \\ 3 \end{bmatrix}$ using Manhattan distance.

x_1	1	1	3	5	2
x_2	1	7	3	4	5
y	0	1	1	0	0

- $A : 0$
- $B : 1$

K Fold Cross Validation

Discussion

- Partition the training set into K groups.
- Pick one group as the validation set.
- Train the model on the remaining training set.
- Repeat the process for each of the K groups.
- Compare accuracy (or cost) for models with different hyperparameters and select the best one.

5 Fold Cross Validation Example

Discussion

Leave One Out Cross Validation

Discussion

- If $K = n$, each time exactly one training instance is left out as the validation set. This special case is called Leave One Out Cross Validation (LOOCV).

Cross Validation

Quiz

- Given the following training data. What is the 2 fold cross-validation accuracy if 1 nearest neighbor classifier with Manhattan distance is used? The first fold is the first five data points.

x	1	1	2	2	3	3	4	4	5	5
y	1	2	3	3	2	2	3	3	2	1

Cross Validation 2

Quiz

- Given the following training data. What is the 10 fold cross-validation (LOOCV) accuracy if 1 nearest neighbor classifier with Manhattan distance is used?

x	1	1	2	2	3	3	4	4	5	5
y	1	2	3	3	2	2	3	3	2	1

- A : 20 percent, B: 40, C: 60, D: 80, E: 100

Lecture Next Week

Admin

- The lecture next week is cancelled.
- The make up lecture will be held Wednesday June 22, the quiz questions will not be graded (everyone gets 1 point), mainly more examples plus optional topics (HMM and RNN).

next next Monday
