#### Discriminative Model vs Generative Model

Motivation

Bayesian Network

Naive Bayes

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

#### Generative Models

- In probability terms, discriminative models are estimating  $\mathbb{P} \{Y|X\}$ , the conditional distribution. For example,  $a_i \approx \mathbb{P} \{y_i = 1|x_i\}$  and  $1 a_i \approx \mathbb{P} \{y_i = 0|x_i\}$ .
- Generative models are estimating ℙ {Y, X}, the joint distribution.
- Bayes rule is used to perform classification tasks.

$$\mathbb{P}\left\{\boldsymbol{Y}|\boldsymbol{X}\right\} = \frac{\mathbb{P}\left\{\boldsymbol{Y},\boldsymbol{X}\right\}}{\mathbb{P}\left\{\boldsymbol{X}\right\}} = \frac{\mathbb{P}\left\{\boldsymbol{X}|\boldsymbol{Y}\right\}\mathbb{P}\left\{\boldsymbol{Y}\right\}}{\mathbb{P}\left\{\boldsymbol{X}\right\}}$$

Bayesian Network

Naive Bayes

#### Joint Distribution

- The joint distribution of  $X_j$  and  $X_{j'}$  provides the probability of  $X_j = x_j$  and  $X_{j'} = x_{j'}$  occur at the same time.  $\mathbb{P}\left\{X_j = x_j, X_{j'} = x_{j'}\right\}$
- The marginal distribution of X<sub>j</sub> can be found by summing over all possible values of X<sub>j'</sub>.

$$\mathbb{P}\left\{X_j = x_j\right\} = \sum_{x \in X_{j'}} \mathbb{P}\left\{X_j = x_j, X_{j'} = x\right\}$$

Bayesian Network

Naive Bayes

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

#### Conditional Distribution

• Suppose the joint distribution is given.

$$\mathbb{P}\left\{X_j=x_j,X_{j'}=x_{j'}\right\}$$

• The conditional distribution of  $X_j$  given  $X_{j'} = x_{j'}$  is ratio between the joint distribution and the marginal distribution.

$$\mathbb{P}\left\{X_{j} = x_{j} | X_{j'} = x_{j'}\right\} = \frac{\mathbb{P}\left\{X_{j} = x_{j}, X_{j'} = x_{j'}\right\}}{\mathbb{P}\left\{X_{j'} = x_{j'}\right\}}$$

Bayesian Network

Naive Bayes

### Bayes Rule Example 1

• Two documents A and B. Suppose A contains 1 "Groot" and 9 other words, and B contains 8 "Groot" and 2 other words. One document is taken out A with probably  $\frac{2}{3}$  and B with probably  $\frac{1}{3}$ , and one word is picked out at random with equal probabilities. The word is "Groot". What is the probability that the document is A?

#### Bayes Rule Example 2 Quiz

• Two documents A and B. Suppose A contains 1 "Groot" and 9 other words, and B contains 8 "Groot" and 2 other words. One document is taken out at random (with equal probability), and one word is picked out at random (all words with equal probability). The word is "Groot". What is the probability that the document is A?

• 
$$A: \frac{1}{9}$$
, B:  $\frac{1}{20}$ , C:  $\frac{2}{5}$ , D:  $\frac{9}{20}$ , E: I don't understand

Bayesian Network

Naive Bayes

## Bayesian Network

- A Bayesian network is a directed acyclic graph (DAG) and a set of conditional probability distributions.
- Each vertex represents a feature X<sub>j</sub>.
- Each edge from  $X_j$  to  $X_{j'}$  represents that  $X_j$  directly influences  $X_{j'}$ .
- No edge between X<sub>j</sub> and X<sub>j'</sub> implies independence or conditional independence between the two features.

Bayesian Network

Naive Bayes

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

### Conditional Independence

 $\mathbb{P}\left\{A, B | C\right\} = \mathbb{P}\left\{A | C\right\} \mathbb{P}\left\{B | C\right\} \text{ or } \mathbb{P}\left\{A | B, C\right\} = \mathbb{P}\left\{A | C\right\}$ 

Bayesian Network

Naive Bayes

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

### Causal Chain

- For three events A, B, C, the configuration A → B → C is called causal chain.
- In this configuration, A is not independent of C, but A is conditionally independent of C given information about B.
- Once B is observed, A and C are independent.

Bayesian Network

Naive Bayes

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

## Common Cause

- For three events A, B, C, the configuration A ← B → C is called common cause.
- In this configuration, A is not independent of C, but A is conditionally independent of C given information about B.
- Once B is observed, A and C are independent.

Bayesian Network

Naive Bayes

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

## Common Effect

- For three events A, B, C, the configuration A → B ← C is called common effect.
- In this configuration, A is independent of C, but A is not conditionally independent of C given information about B.
- Once B is observed, A and C are not independent.

# Training Bayes Net

Training a Bayesian network given the DAG is estimating the conditional probabilities. Let P (X<sub>j</sub>) denote the parents of the vertex X<sub>j</sub>, and p (X<sub>j</sub>) be realizations (possible values) of P (X<sub>j</sub>).

$$\mathbb{P}\left\{x_{j}|\boldsymbol{\rho}\left(X_{j}\right)\right\},\boldsymbol{\rho}\left(X_{j}\right)\in\boldsymbol{P}\left(X_{j}\right)$$

 It can be done by maximum likelihood estimation given a training set.

$$\widehat{\mathbb{P}}\left\{x_{j} | p\left(X_{j}\right)\right\} = \frac{c_{x_{j}, p}(x_{j})}{c_{p}(x_{j})}$$

Bayesian Network

Bayesian Network

Naive Bayes

### Laplace Smoothing

Recall that the MLE estimation can incorporate Laplace smoothing.

$$\widehat{\mathbb{P}}\left\{x_{j}|p\left(X_{j}\right)\right\} = \frac{c_{x_{j},p}(x_{j})+1}{c_{p}(x_{j})+|X_{j}|}$$

- Here,  $|X_j|$  is the number of possible values (number of categories) of  $X_{j.}$
- Laplace smoothing is considered regularization for Bayesian networks because it avoids overfitting the training data.

Bayesian Network

Naive Bayes

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

## Bayes Net Inference 1

• Given the conditional probability table, the joint probabilities can be calculated using conditional independence.

$$\mathbb{P} \{x_1, x_2, ..., x_m\} = \prod_{j=1}^m \mathbb{P} \{x_j | x_1, x_2, ..., x_{j-1}, x_{j+1}, ..., x_m\}$$
$$= \prod_{j=1}^m \mathbb{P} \{x_j | p(X_j)\}$$

Bayesian Network

Naive Bayes

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

#### Bayes Net Inference 2 Definition

• Given the joint probabilities, all other marginal and conditional probabilities can be calculated using their definitions.

$$\mathbb{P} \{ x_j | x_{j'}, x_{j''}, ... \} = \frac{\mathbb{P} \{ x_j, x_{j'}, x_{j''}, ... \}}{\mathbb{P} \{ x_{j}, x_{j'}, x_{j''}, ... \}}$$
$$\mathbb{P} \{ x_j, x_{j'}, x_{j''}, ... \} = \sum_{\substack{X_k : k \neq j, j', j'', ... \\ X_k : k \neq j', j'', ... }} \mathbb{P} \{ x_1, x_2, ..., x_m \}$$

Bayesian Network

Naive Bayes

## Bayes Net Inference Example 1

#### Network Structure

- Selecting from all possible structures (DAGs) is too difficult.
- Usually, a Bayesian network is learned with a tree structure.
- Choose the tree that maximizes the likelihood of the training data.

Bayesian Network

Naive Bayes

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

## Chow Liu Algorithm

- Add an edge between features X<sub>j</sub> and X<sub>j'</sub> with edge weight equal to the information gain of X<sub>j</sub> given X<sub>j'</sub> for all pairs j, j'.
- Find the maximum spanning tree given these edges. The spanning tree is used as the structure of the Bayesian network.

Naive Bayes

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

#### Classification Problem

- Bayesian networks do not have a clear separation of the label Y and the features  $X_1, X_2, ..., X_m$ .
- The Bayesian network with a tree structure and Y as the root and  $X_1, X_2, ..., X_m$  as the leaves is called the Naive Bayes classifier.
- Bayes rules is used to compute P {Y = y | X = x}, and the prediction ŷ is y that maximizes the conditional probability.
   ŷ<sub>i</sub> = argmax P {Y = y | X = x<sub>i</sub>}

Bayesian Network

Naive Bayes

#### Naive Bayes Diagram

Discussion

Bayesian Network

Naive Bayes

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

#### Multinomial Naive Bayes

• The implicit assumption for using the counts as the maximum likelihood estimate is that the distribution of  $X_j | Y = y$ , or in general,  $X_j | P(X_j) = p(X_j)$  has the multinomial distribution.

$$\mathbb{P}\left\{X_{j}=x|Y=y
ight\}=p_{X}$$
 $\hat{p}_{X}=rac{c_{X,y}}{c_{Y}}$ 

Bayesian Network

Naive Bayes

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

#### Gaussian Naive Bayes

- If the features are not categorical, continuous distributions can be estimated using MLE as the conditional distribution.
- Gaussian Naive Bayes is used if  $X_j | Y = y$  is assumed to have the normal distribution.

$$\lim_{\varepsilon \to 0} \frac{1}{\varepsilon} \mathbb{P} \left\{ x < X_j \leq x + \varepsilon | Y = y \right\} = \frac{1}{\sqrt{2\pi} \sigma_y^{(j)}} \exp \left( -\frac{\left( x - \mu_y^{(j)} \right)^2}{2 \left( \sigma_y^{(j)} \right)^2} \right)$$

Bayesian Network

Naive Bayes

#### Gaussian Naive Bayes Training Discussion

- Training involves estimating  $\mu_y^{(j)}$  and  $\sigma_y^{(j)}$  since they completely determine the distribution of  $X_i | Y = y$ .
- The maximum likelihood estimates of  $\mu_y^{(j)}$  and  $\left(\sigma_y^{(j)}\right)^2$  are the sample mean and variance of the feature j.

$$\hat{\mu}_{y}^{(j)} = \frac{1}{n_{y}} \sum_{i=1}^{n} x_{ij} \mathbb{1}_{\{y_{i}=y\}}, n_{y} = \sum_{i=1}^{n} \mathbb{1}_{\{y_{i}=y\}}$$
$$\left(\hat{\sigma}_{y}^{(j)}\right)^{2} = \frac{1}{n_{y}} \sum_{i=1}^{n} \left(x_{ij} - \hat{\mu}_{y}^{(j)}\right)^{2} \mathbb{1}_{\{y_{i}=y\}}$$
sometimes  $\left(\hat{\sigma}_{y}^{(j)}\right)^{2} \approx \frac{1}{n_{y} - 1} \sum_{i=1}^{n} \left(x_{ij} - \hat{\mu}_{y}^{(j)}\right)^{2} \mathbb{1}_{\{y_{i}=y\}}$

Naive Bayes

### Tree Augmented Network Algorithm

- It is also possible to create a Bayesian network with all features X<sub>1</sub>, X<sub>2</sub>, ..., X<sub>m</sub> connected to Y (Naive Bayes edges) and the features themselves form a network, usually a tree (MST edges).
- Information gain is replaced by conditional information gain (conditional on Y) when finding the maximum spanning tree.
- This algorithm is called TAN: Tree Augmented Network.
