

Joint Distribution

Motivation

- The joint distribution of X_j and $X_{j'}$ provides the probability of $X_j = x_j$ and $X_{j'} = x_{j'}$ occur at the same time.

$$\mathbb{P} \{ X_j = x_j, X_{j'} = x_{j'} \}$$

- The marginal distribution of X_j can be found by summing over all possible values of $X_{j'}$.

$$\mathbb{P} \{ X_j = x_j \} = \sum_{x \in X_{j'}} \mathbb{P} \{ X_j = x_j, X_{j'} = x \}$$

Conditional Distribution

Motivation

- Suppose the joint distribution is given.

$$\mathbb{P} \{ X_j = x_j, X_{j'} = x_{j'} \}$$

- The conditional distribution of X_j given $X_{j'} = x_{j'}$ is ratio between the joint distribution and the marginal distribution.

$$\mathbb{P} \{ X_j = x_j | X_{j'} = x_{j'} \} = \frac{\mathbb{P} \{ X_j = x_j, X_{j'} = x_{j'} \}}{\mathbb{P} \{ X_{j'} = x_{j'} \}}$$

Bayes Rule Example 1

Quiz

- Two documents A and B . Suppose A contains 1 "Groot" and 9 other words, and B contains 8 "Groot" and 2 other words. One document is taken out A with probably $\frac{2}{3}$ and B with probably $\frac{1}{3}$, and one word is picked out at random with equal probabilities. The word is "Groot". What is the probability that the document is A ?

Training Bayes Net

Definition

- Training a Bayesian network given the DAG is estimating the conditional probabilities. Let $P(X_j)$ denote the parents of the vertex X_j , and $p(X_j)$ be realizations (possible values) of $P(X_j)$.

$$\mathbb{P}\{x_j | p(X_j)\}, p(X_j) \in P(X_j)$$

- It can be done by maximum likelihood estimation given a training set.

$$\hat{\mathbb{P}}\{x_j | p(X_j)\} = \frac{c_{x_j, p(X_j)}}{c_{p(X_j)}}$$

Laplace Smoothing

Definition

- Recall that the MLE estimation can incorporate Laplace smoothing.

$$\hat{\mathbb{P}}\{x_j | p(X_j)\} = \frac{c_{x_j, p(X_j)} + 1}{c_{p(X_j)} + |X_j|}$$

Q 1

2

- Here, $|X_j|$ is the number of possible values (number of categories) of X_j .
- Laplace smoothing is considered regularization for Bayesian networks because it avoids overfitting the training data.

Bayes Net Inference 1

Definition

- Given the conditional probability table, the joint probabilities can be calculated using conditional independence.

$$\begin{aligned}\mathbb{P}\{x_1, x_2, \dots, x_m\} &= \prod_{j=1}^m \mathbb{P}\{x_j | x_1, x_2, \dots, x_{j-1}, x_{j+1}, \dots, x_m\} \\ &= \prod_{j=1}^m \mathbb{P}\{x_j | p(X_j)\}\end{aligned}$$

Bayes Net Inference 2

Definition

- Given the joint probabilities, all other marginal and conditional probabilities can be calculated using their definitions.

$$\mathbb{P} \{x_j | x_{j'}, x_{j''}, \dots\} = \frac{\mathbb{P} \{x_j, x_{j'}, x_{j''}, \dots\}}{\mathbb{P} \{x_{j'}, x_{j''}, \dots\}}$$

$$\mathbb{P} \{x_j, x_{j'}, x_{j''}, \dots\} = \sum_{x_k: k \neq j, j', j'', \dots} \mathbb{P} \{x_1, x_2, \dots, x_m\}$$

$$\mathbb{P} \{x_{j'}, x_{j''}, \dots\} = \sum_{x_k: k \neq j', j'', \dots} \mathbb{P} \{x_1, x_2, \dots, x_m\}$$
