

CS 764: Topics in Database Management Systems

Lecture 1: Introduction

Xiangyao Yu

09/07/2022

Who am I?

Name: [Xiangyao Yu](#)

Assistant professor in [Computer Sciences](#), [Database Group](#)

Postdoc and PhD at MIT on databases and computer architecture

Research interests:

- Cloud-native databases
- New hardware for database
- Transactions and HTAP

Basic Information

Course website: <https://pages.cs.wisc.edu/~yxy/cs764-f22/index.html>

Instructor: Xiangyao Yu

Office hours:

- Monday 2:30pm–3:30pm CS 4361
- Or schedule by email

TA: Keren Chen

Office hours: schedule by email

Piazza for discussions and questions

Today's Agenda

Database 101

Course logistics

Database 101

Database: A collection of data, typically describing the activities of one or more related organizations. For example:

- Entities: students, instructors, courses
- Relationships: students enroll in courses, instructors teach courses

Database 101

Database: A collection of data, typically describing the activities of one or more related organizations. For example:

- Entities: students, instructors, courses
- Relationships: students enroll in courses, instructors teach courses

Database management system (DBMS): Software designed to assist in **maintaining** and **utilizing large collection** of data.

Relational Model

A relational database is a **collection of one or more relations**, where each relation is a **table with rows and columns**.

An example relation:

table name

Product

name	category	price	manufacturer
iPad	tablet	\$399.00	Apple
Surface	tablet	\$299.00	Microsoft
...

Relational Model

A relational database is a **collection of one or more relations**, where each relation is a **table with rows and columns**.

An example relation:

table name

Product

name	category	price	manufacturer
iPad	tablet	\$399.00	Apple
Surface	tablet	\$299.00	Microsoft
...

record/tuple/row

Relational Model

A relational database is a **collection of one or more relations**, where each relation is a **table with rows and columns**.

An example relation:

table name

Product

attribute/column

name	category	price	manufacturer
iPad	tablet	\$399.00	Apple
Surface	tablet	\$299.00	Microsoft
...

record/tuple/row

SQL Queries

SELECT a_1, a_2, \dots, a_k
FROM R_1, R_2, \dots, R_n
WHERE conditions

A Database Template

SELECT a_1, a_2, \dots, a_k
FROM R_1, R_2, \dots, R_n
WHERE conditions

```
answer = {}                               Vanilla query executor
for  $t_1$  in  $R_1$  do
    for  $t_2$  in  $R_2$  do
        ...
        for  $t_n$  in  $R_n$  do
            if conditions
                then answer = answer  $\cup$   $\{(a_1, \dots, a_k)\}$ 
return answer
```

A Database Template

```
SELECT      a1, a2, ..., ak
FROM        R1, R2, ..., Rn
WHERE       conditions
```

```
answer = {}
for t1 in R1 do
  for t2 in R2 do
    ...
    for tn in Rn do
      if conditions
        then answer = answer U { (a1, ..., ak) }
return answer
```

Vanilla query executor

A Database Template

```
SELECT    a1, a2, ..., ak
FROM      R1, R2, ..., Rn
WHERE     conditions
```

```
answer = {}
for t1 in R1 do
  for t2 in R2 do
    ...
    for tn in Rn do
      if conditions
        then answer = answer U { (a1, ..., ak) }
return answer
```

Vanilla query executor

A DBMS can be heavily optimized beneath this simple interface

Optimizing the Template Implementation

```
SELECT    a1, a2, ..., ak
FROM      R1, R2, ..., Rn
WHERE     conditions
```

```
answer = {}
for t1 in R1 do
  for t2 in R2 do
    ...
    for tn in Rn do
      if conditions
        then answer = answer U { (a1, ..., ak) }
return answer
```

Vanilla query executor

Cross products are expensive, can replace with **joins**

Optimizing the Template Implementation

```
SELECT    a1, a2, ..., ak
FROM      R1, R2, ..., Rn
WHERE     conditions
```

```
answer = {}
for t1 in R1 do
  for t2 in R2 do
    ...
    for tn in Rn do
      if conditions
        then answer = answer U { (a1, ..., ak) }
return answer
```

Vanilla query executor

Cross products are expensive, can replace with **joins**

Avoid scanning the entire table by accessing subsets of records through an **index**

Optimizing the Template Implementation

```
SELECT    a1, a2, ..., ak
FROM      R1, R2, ..., Rn
WHERE     conditions
```

```
answer = {}
for t1 in R1 do
  for t2 in R2 do
    ...
    for tn in Rn do
      if conditions
        then answer = answer ∪ { (a1, ..., ak) }
return answer
```

Vanilla query executor

Cross products are expensive, can replace with **joins**

Avoid scanning the entire table by accessing subsets of records through an **index**

Query plan can be **optimized** to minimize the execution overhead

Optimizing the Template Implementation

```
SELECT    a1, a2, ..., ak
FROM      R1, R2, ..., Rn
WHERE     conditions
```

Data can be stored in disks for persistency and low cost and **buffered** in DRAM

```
answer = {}
for t1 in R1 do
  for t2 in R2 do
    ...
    for tn in Rn do
      if conditions
        then answer = answer ∪ { (a1, ..., ak) }
return answer
```

Vanilla query executor

Cross products are expensive, can replace with **joins**

Avoid scanning the entire table by accessing subsets of records through an **index**

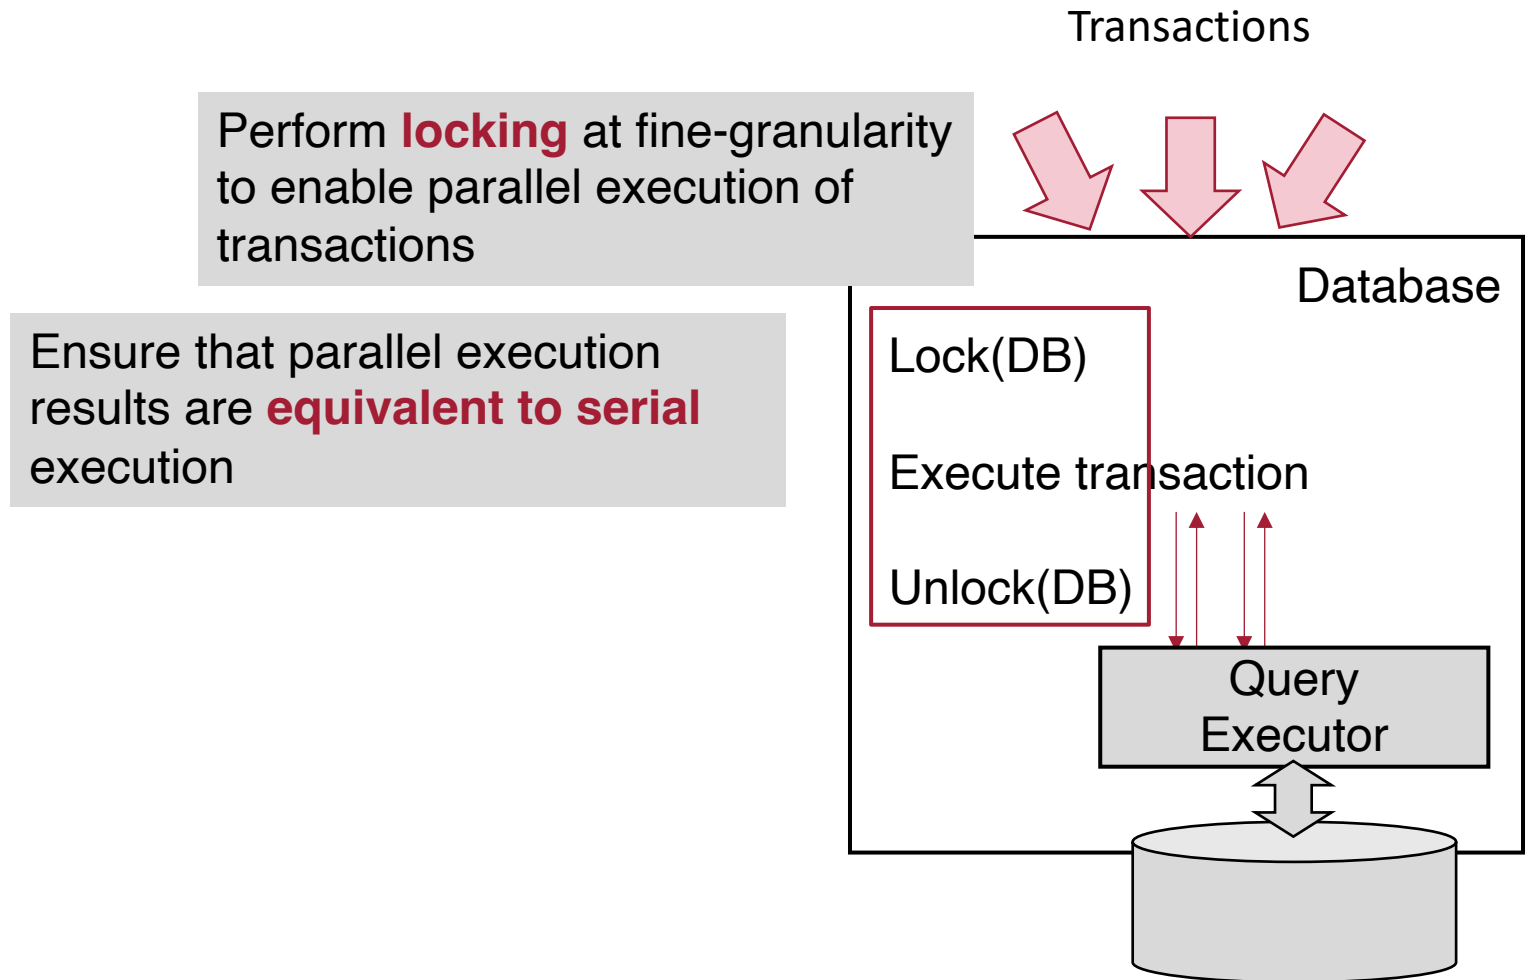

Query plan can be **optimized** to minimize the execution overhead

Optimizing the Template Implementation

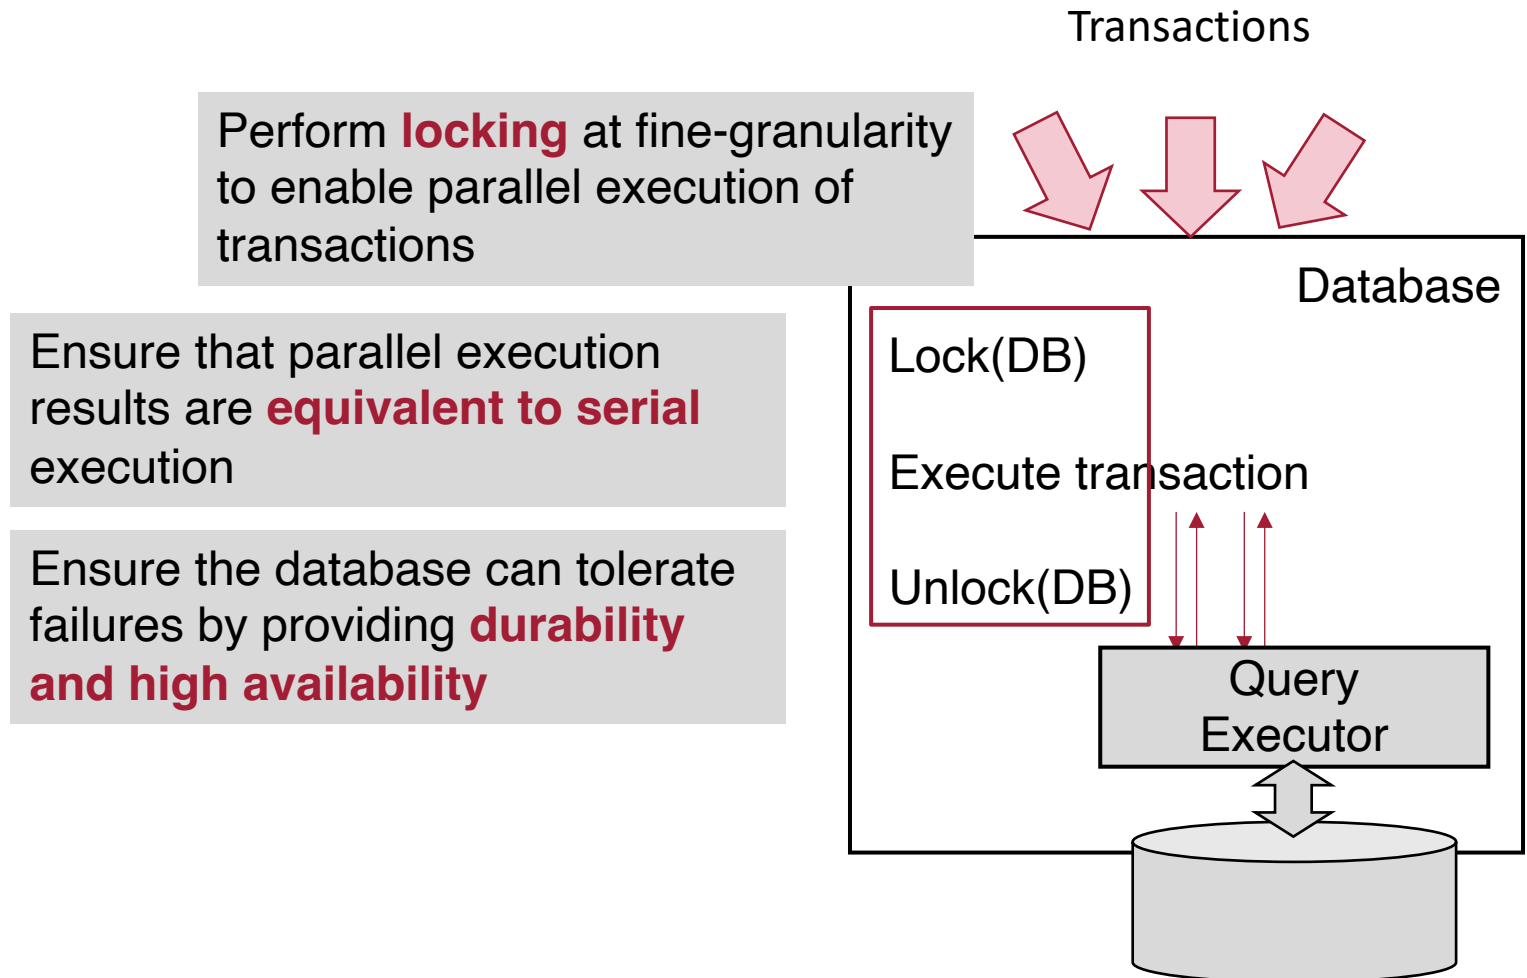

Perform **locking** at fine-granularity to enable parallel execution of transactions

Optimizing the Template Implementation

Optimizing the Template Implementation

Optimizing the Template Implementation

Topics in CS 764

Query processing and buffer management (Lectures 2–8)

- Join
- Buffer management
- Query optimization
- Column store
- Parallel database

Advanced transaction processing (Lectures 9–20)

- Two-phase locking
- Isolation
- Optimistic concurrency control
- B-tree and radix-tree
- Fault tolerance

Advanced topics in databases (Lectures 21–27)

- Cloud-native databases
- Database with new hardware technologies

Guest lectures from Oracle and TiDB

Course Logistics

Course Information

Course Website: <http://pages.cs.wisc.edu/~yxy/cs764-f22/>

Canvas page: <https://canvas.wisc.edu/courses/309574>

Piazza: piazza.com/wisc/fall2022/cs764/

Zoom: You can take the lectures online

- <https://uwmadison.zoom.us/j/93625999493?pwd=Si9PWEdpWnhNaTdxMG1zVXFFcXk0QT09>
- passcode: 764

Prerequisite: CS 564

Reference textbooks:

- Red book
- Cow book

Grading

Paper review: 15%

Exam: 35%

Project proposal: 10%

Project presentation: 10%

Project final report: 30%

Paper Review (15%)

- Paper reading:** one classic/modern paper per lecture
- username: cs764 password: dbguru

Paper Review (15%)

Paper reading: one classic/modern paper per lecture

- username: cs764 password: dbguru

Upload review: <https://wisc-cs764-f22.hotcrp.com> (must submit before the lecture starts in order to be graded)

- Overall merit
- Paper summary
 - What main research problem/challenge did the paper address?
 - What is the key contribution of the paper?
- **Comments and questions**
 - Aspects you like or dislike about the paper
 - Questions about that paper that you wish to be discussed in the lecture

- Overall merit
- Paper summary
 - What main research problem/challenge did the paper address?
 - What is the key contribution of the paper?
- **Comments and questions**
 - Aspects you like or dislike about the paper
 - Questions about that paper that you wish to be discussed in the lecture

Grading: You can skip up to 2 reviews without losing points; otherwise 1% of total grade (up to 15%) is deducted for each missing review

Exam (35%)

In-class exam

- Open-book, open-notes
- You can use any material provided in this course or on the Internet

One lecture to review exams in previous years

Sample exam questions are available on course website

Course Project (50%)

In **groups of 2–4** students

Project ideas will be provided but you are encouraged to propose your own ideas

- Project ideas for Fall 2020 and 2021 are available on the course website
- Three example projects are available on the course website (two papers based on course projects accepted to SIGMOD 2022 and SIGMOD 2023)

Course Project (50%)

In **groups of 2–4** students

Project ideas will be provided but you are encouraged to propose your own ideas

- Project ideas for Fall 2020 and 2021 are available on the course website
- Three example projects are available on the course website (two papers based on course projects accepted to SIGMOD 2022 and SIGMOD 2023)

Important dates

- Create teams and submit proposal: Oct. 24
- Project meetings with instructor: Nov. 21
- Presentation: Dec. 12 & 14
- Paper submission: Dec. 19

Computation Resources

CloudLab

<https://www.cloudlab.us/signup.php?pid=NextGenDB> (project name: NextGenDB)

Chameleon

<https://www.chameleoncloud.org> (project name: ngdb)

Lectures in Hybrid Mode

Each lecture will be streamed online on zoom

- <https://uwmadison.zoom.us/j/93625999493?pwd=Si9PWEdpWnhNaTdxMG1zVXFFcXk0QT09> (passcode: 764)

Lectures will be recorded and the video recording will be available on canvas (canvas -> zoom)

Waitlist

Class size limited to ~60

If you are enrolled but don't want to take the class, please drop ASAP

If you are on the waitlist, we will admit students first-come-first-serve

Before next lecture

Read the following paper and submit review

- Leonard D. Shapiro, Join Processing in Database Systems with Large Main Memories. ACM Trans. Database Syst. 1986.

Email the instructor if you have problems registering for <https://wisc-cs764-f22.hotcrp.com> after Friday

Enroll on Piazza

- piazza.com/wisc/fall2022/cs764/
